About this Document

This document is for Cisco Ecosystem Partners, Cisco Security Technical Alliances (CSTA) Partners and Cisco Internal Solutions implementing Cisco Platform Exchange Grid (pxGrid 2.0). This document accompanies the Cisco Devnet WebSockets & REST API Cisco pxGrid (2.0) development document.

<https://developer.cisco.com/docs/pxgrid-api/>

Cisco pxGrid 2.0 does not rely on “java” and “c” SDK’s for development as was the case with Cisco pxGrid 1.0. Instead Cisco pxGrid 2.0 relies on WebSockets & REST API over the STOMP messaging protocol, which alleviates the dependency on SDK’s for development. The developer may now use python for pxGrid application development.

This document explains how WebSockets & REST APIs are used in Cisco pxGrid 2.0, and STOMP is the underlying messaging protocol. Code examples are provided to help in code development.

Cisco pxGrid Context-In is a new feature in ISE 2.4, where Internet of Technology (IOT) solutions can provide their asset data for Cisco Identity Services Engine (ISE) to consume and incorporate with the ISE Profiling Policies. An IOT organization’ security policy can then be written by assigning these ISE Profiling Policies to ISE Authorization Profiles.

An API_Simulator.JAR file is included to learn the details of Cisco pxGrid Context-In. This simulates a pxGrid client publishing asset information and ISE taking this context in via pxGrid. Coding examples for this JAR file are also provided.

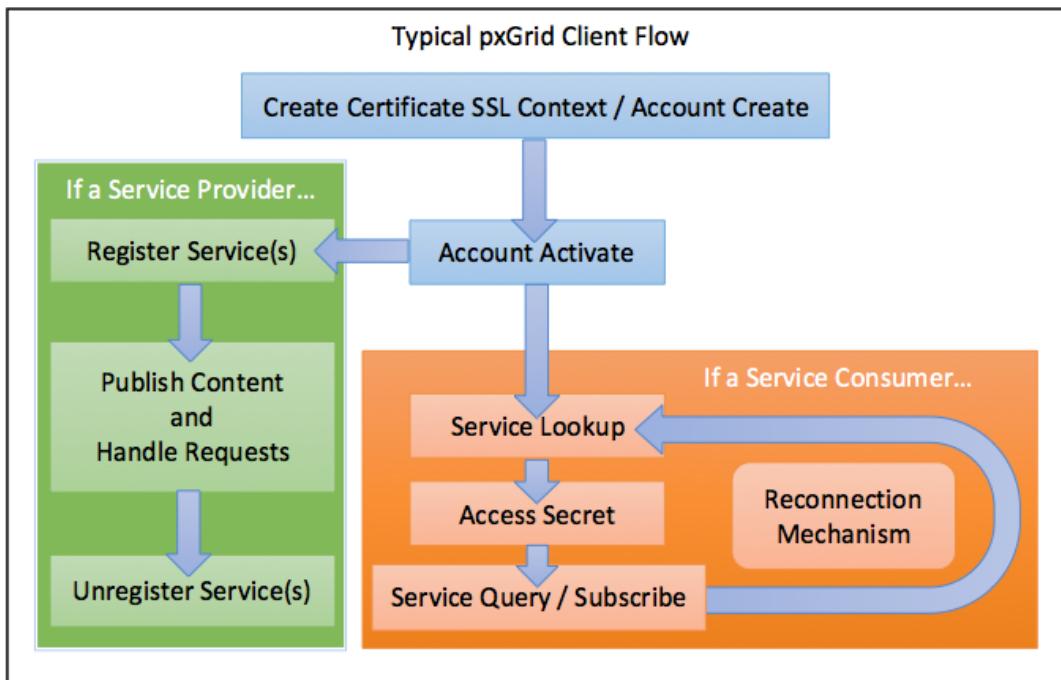

Chrome POSTMAN is a web-based REST Client that allows you to enter and monitor HTTP requests and responses. This will be used to explain the concepts of WebSockets & REST APIs.

Technical Overview

Cisco Platform Exchange Grid (pxGrid) 2.0 is based on a REpresentational State Transfer (REST) and WebSockets Model, over the Simple Text Oriented Protocol (STOMP) messaging protocol. WebSockets provide quick and scalable bi-directional data transfer, while REST provides quick extensible querying mechanisms – all over the same interface. pxGrid utilizes WebSockets for pubsub components while all one-shot queries (for both control and service data) is done via REST. All message bodies are formatted in JSON.

Cisco pxGrid will use port 8910 on ISE for pxGrid-related REST and WebSocket communications. Messages over Websockets will be sent and received in binary format, these messages should conform to the STOMP messaging protocol. For more information on supported commands on pxGrid please see: <https://github.com/cisco-pxgrid/pxgrid-rest-ws/wiki>

The following represents the typical pxGrid 2.0 client flow:

Create Certificate SSL Context / Account Create

All clients must authenticate to the ISE pxGrid controller either via certificate-based SSL authentication or username-password authentication.

Account Activate

All clients request to activate their accounts on the pxGrid server which is handled by the REST API.

Register/Unregister Service

Service providers will use these APIs to provide and update the necessary information (i.e. resource URLs) from which their services are accessible for other pxGrid clients.

Service Lookup

All clients can use this API to dynamically discover all available provider services and their locations.

Access Secret

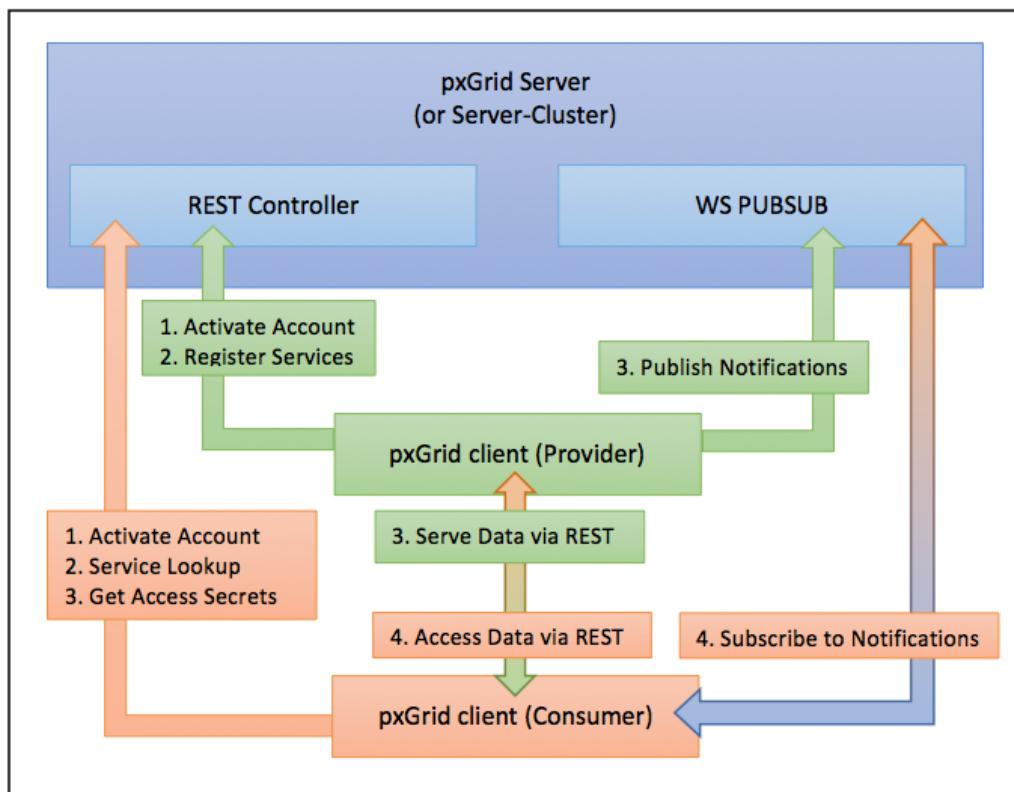

For every service returned that interests a particular client, that client must also query the pxGrid controller for an access secret in order to obtain the information provided by the service.

Service Query / Subscribe

With the access secret and service location information in hand, client can then perform REST-based queries or build WebSocket connections to receive information.

We will go through an example of authenticating and registering a pxGrid client using Chrome POSTMAN as the REST client. An account will be created and activated. The pxGrid client will request the session topic or service from the ISE pxGrid node via a service lookup. The service lookup will return the WebSockets URL (WsURL) resource and the ISE node that publishes this session topic. The pxGrid client will then obtain an access secret and retrieve the session information based on the WsURL resource.

The following is a visual representation with the REST and WebSocket architecture:

This representation shows the pxGrid client provider or publisher publishing notifications or topics to the pxGrid controller via WebSockets and another pxGrid client consumer subscribing to these notification or topics.

Cisco pxGrid Context-In follows the same pxGrid client flow and will be discussed in detail in the *Cisco pxGrid Context-in* Section.

Illustrating Cisco pxGrid Client Flow using Chrome Postman

Chrome POSTMAN will be used to illustrate Cisco pxGrid Client Flow using REST API. First Cisco pxGrid is enabled. Chrome POSTMAN can be downloaded from:

<https://chrome.google.com/webstore/detail/postman/fhbjgbiflinjbdfgehcddcbnccccdomop?hl=en>

The following steps are as follows:

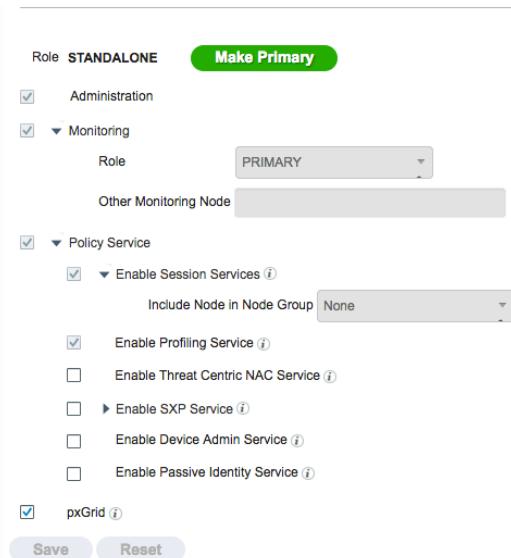

- Enabling pxGrid on the ISE Node
- Import the ISE identity certificates into your browser
- Creating the pxGrid client Account
- Enabling the Account
- Activating the Account
- Performing Services Lookup
- Obtaining the Access Secret
- Run GetSessionByIPAddress WebSockets REST API script

Please note that the pxGridcontrol.java code sample uses the same logic. This is a good way to check your coding as well.

Enabling pxGrid

Step 1 Enable pxGrid

Select Administration->System Deployment->Edit Node->Enable pxGrid

The screenshot shows the 'Edit Node' configuration page for a node named 'ISE-Node'. The 'Role' dropdown is set to 'STANDALONE' and 'PRIMARY'. Under the 'pxGrid' section, the 'pxGrid' checkbox is checked. Other checkboxes available but unchecked include 'Administration', 'Monitoring', 'Policy Service' (with 'Enable Session Services' checked), 'Enable Profiling Service', 'Enable Threat Centric NAC Service', 'Enable SXP Service', 'Enable Device Admin Service', and 'Enable Passive Identity Service'. At the bottom are 'Save' and 'Reset' buttons.

Step 2 Select Save

Step 3 Verify that the ISE published nodes appear
Select **Administration->pxGrid Services**

All Clients	Web Clients	Capabilities	Live Log	Settings	Certificates	Permissions	Enable	Disable	Approve	Group	Decline	Delete	Refresh	Total Pending Approval(0)	1 - 6 of 6	Show 25	per page	Page 1
ise-mnt-ise24prod		Capabilities(2 Pub, 1 Sub)	Online (XMPP)	Internal	Certificate	View	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>									
ise-admin-ise24prod		Capabilities(4 Pub, 2 Sub)	Online (XMPP)	Internal	Certificate	View	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>									
ise-fanout-ise24prod		Capabilities(0 Pub, 0 Sub)	Online (XMPP)	Internal	Certificate	View	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>									
ise-pubsub-ise24prod		Capabilities(0 Pub, 0 Sub)	Online (XMPP)	Internal	Certificate	View	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>									
ise-bridge-ise24prod		Capabilities(0 Pub, 4 Sub)	Online (XMPP)	Internal	Certificate	View	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>									

and you have connectivity

Connected to pxGrid ise24prod.lab10.com

Exporting the ISE Identity Certificate into your Browser

Export the ISE identity certificate, into the PC's truststore. A MacBook Pro was used in this example.

References: <https://github.com/cisco-pxgrid/pxgrid-rest-ws/wiki>

Step 1 Import ISE identity certificate into Chrome browser and set to “always trust”

ise24prod.lab10.com
Root certificate authority
Expires: Sunday, March 31, 2019 at 6:50:03 PM Eastern Daylight Time
✖ This root certificate is not trusted

▼ Trust

When using this certificate: Always Trust

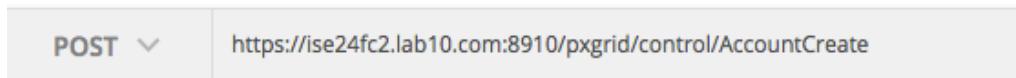

Secure Sockets Layer (SSL)	Always Trust
Secure Mail (S/MIME)	Always Trust
Extensible Authentication (EAP)	Always Trust
IP Security (IPsec)	Always Trust
Code Signing	Always Trust
Time Stamping	Always Trust
X.509 Basic Policy	Always Trust

Step 2 Ensure that you have “Allowed password based account creation” enabled under **Administration->pxGrid Services->Settings->pxGrid Settings****Step 3** Close out the browser and log back in again

Creating the pxGrid client Account

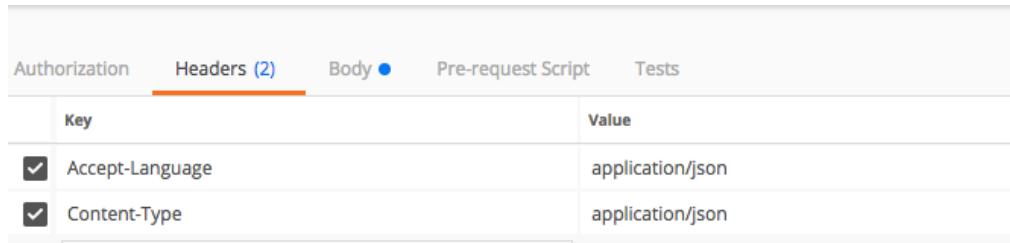

The initial pxGrid client account will be created and returned username and password will be used to access other WebSocket REST calls. For example, this authentication will be used later to determine the ISE peer node for a service lookup that contains the session topic.

- Step 1** Create an account and obtain the username and password that will be used for basic authentication for the other WebSocket REST API calls. In this exercise we will be using password-based authentication.

A screenshot of the Postman application interface. The top bar shows 'POST' and the URL 'https://ise24fc2.lab10.com:8910/pxgrid/control/AccountCreate'. The 'Headers' tab is selected, showing two entries: 'Accept-Language: application/json' and 'Content-Type: application/json'. The 'Body' tab is also visible below the headers.

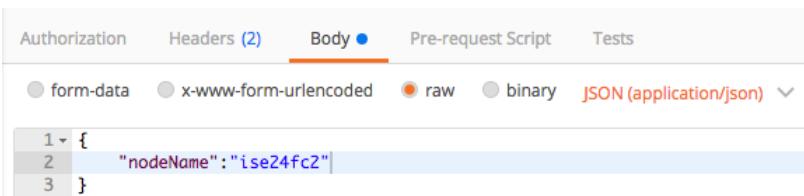

- Step 2** Define the following Headers:

A screenshot of the Postman 'Headers' section. It shows two entries: 'Accept-Language' with value 'application/json' and 'Content-Type' with value 'application/json'. The 'Authorization' tab is also present but not selected.

- Step 3** The body should read:

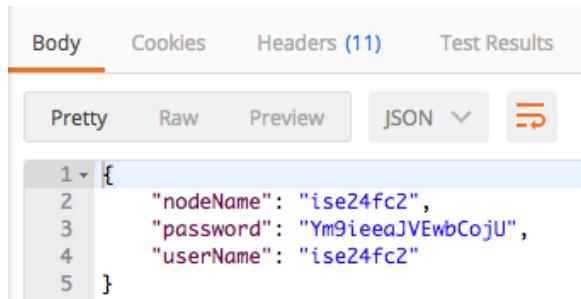

Note: The nodeName provides the pxGrid client name. Please note that the nodename must be Fully Qualified Domain (FQDN) resolvable.

A screenshot of the Postman 'Body' section. The 'JSON (application/json)' tab is selected. The JSON payload is defined as follows:

```
1 {  
2   "nodeName": "ise24fc2"  
3 }
```

- Step 4** You will receive the username and password that will be used for other WebSockets REST calls. The node name represents the pxGrid client node.

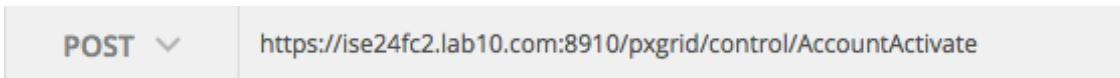

A screenshot of the Postman 'Body' section after the request is made. The 'JSON' tab is selected, showing the response body as a JSON object:

```
1 {  
2   "nodeName": "ise24fc2",  
3   "password": "Ym9ieeaJVEwbCojU",  
4   "userName": "ise24fc2"  
5 }
```

Activating the Account

The account needs to be activated by the ISE or pxGrid admin before the pxGrid client can register to the ISE pxGrid node.

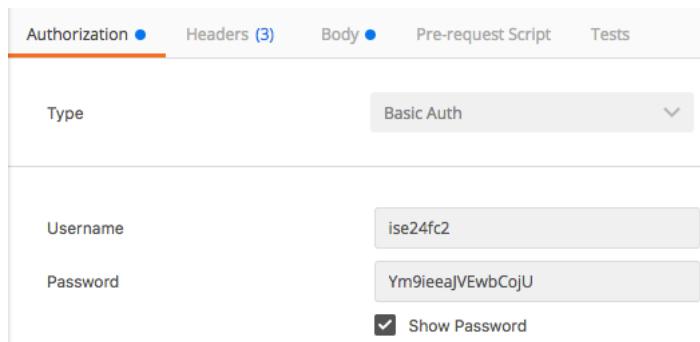

Step 1 Activate the account

A screenshot of a POST request in Postman. The URL is <https://ise24fc2.lab10.com:8910/pxgrid/control/AccountActivate>.

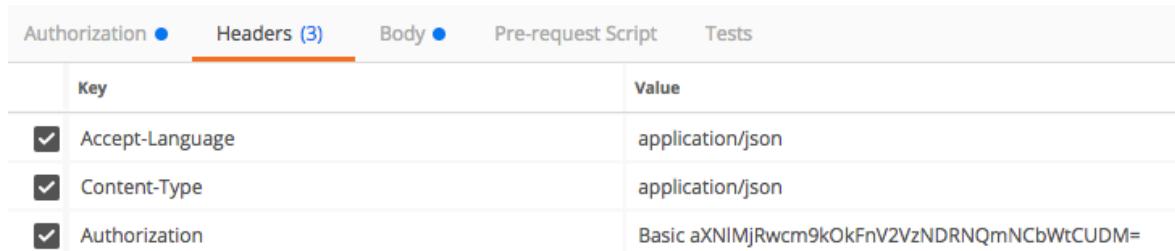

Step 2 Add the following authorization settings:

Note: The username and password are from step 6 above, or the results of the account creation.

A screenshot of the Authorization tab in Postman. The Type is set to Basic Auth. The Username is ise24fc2 and the Password is Ym9ieeaJVewbCojU. A checkbox for Show Password is checked.

Step 3 Add the following headers, the authorization header will appear after the username and password have been configured.

A screenshot of the Headers tab in Postman. It shows three headers: Accept-Language (application/json), Content-Type (application/json), and Authorization (Basic aXNIMjRwcm9kOkFnV2VzNDRNQmNCbWtCUDM=).

Key	Value
Accept-Language	application/json
Content-Type	application/json
Authorization	Basic aXNIMjRwcm9kOkFnV2VzNDRNQmNCbWtCUDM=

Step 4 You will be in the pending state until the ISE admin approves the account

A screenshot of the Body tab in Postman. The response is a JSON object with two fields: "accountState": "PENDING" and "version": "2.0.0.13".

```
1 {  
2   "accountState": "PENDING",  
3   "version": "2.0.0.13"  
4 }
```

Step 5 In ISE, you will see pxGrid client name (nodename) in the pending state

Note: Regardless of enabled password-based authentication for client settings, the admin will still have to approve the pending client request.

All Clients	Web Clients	Capabilities	Live Log	Settings	Certificates	Permissions	
<input checked="" type="checkbox"/> Client Name	Client Description	Capabilities	Status	Client Group(s)	Auth Method	Log	
<input type="checkbox"/> ise-pubsub-ise24fc2		Capabilities(0 Pub, 0 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-bridge-ise24fc2		Capabilities(0 Pub, 4 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-mnt-ise24fc2		Capabilities(2 Pub, 1 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-admin-ise24fc2		Capabilities(6 Pub, 2 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-fanout-ise24fc2		Capabilities(0 Pub, 0 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise24fc2	Websokets_App	Capabilities(0 Pub, 0 Sub)	Pending		UserNmae/Password	View	

Step 6 Select “ise24fc2” and “Approve”

Step 7 You will see the following message:

All Clients	Web Clients	Capabilities	Live Log	Settings	Certificates	Permissions	
<input checked="" type="checkbox"/> Client Name	Client Description	Capabilities	Status	Client Group(s)	Auth Method	Log	
<input type="checkbox"/> ise-pubsub-ise24fc2		Capabilities(0 Pub, 0 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-bridge-ise24fc2		Capabilities(0 Pub, 4 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-mnt-ise24fc2		Capabilities(2 Pub, 1 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-admin-ise24fc2		Capabilities(6 Pub, 2 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-fanout-ise24fc2		Capabilities(0 Pub, 0 Sub)	Online (XMPP)	Internal	Certificate	View	
<input checked="" type="checkbox"/> ise24fc2	Websokets_App	Capabilities(0 Pub, 0 Sub)	Pending		UserNmae/Password	View	

Step 8 Select “Yes”

Step 9 You should see:

All Clients	Web Clients	Capabilities	Live Log	Settings	Certificates	Permissions	
<input checked="" type="checkbox"/> Client Name	Client Description	Capabilities	Status	Client Group(s)	Auth Method	Log	
<input type="checkbox"/> ise-pubsub-ise24fc2		Capabilities(0 Pub, 0 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-bridge-ise24fc2		Capabilities(0 Pub, 4 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-mnt-ise24fc2		Capabilities(2 Pub, 1 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-admin-ise24fc2		Capabilities(6 Pub, 2 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise-fanout-ise24fc2		Capabilities(0 Pub, 0 Sub)	Online (XMPP)	Internal	Certificate	View	
<input type="checkbox"/> ise24fc2	Websokets_App	Capabilities(0 Pub, 0 Sub)	Offline (XMPP)		UserNmae/Password	View	

Step 10 If you re-run REST client request again, the account will be enabled

```

Body Cookies Headers (11) Test Results
Pretty Raw Preview JSON ↴
1 { "accountState": "ENABLED", "version": "2.0.0.13" }
2
3
4

```

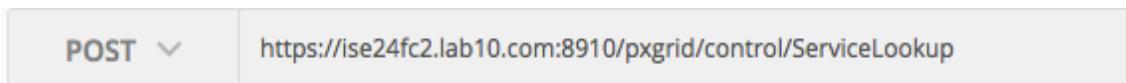

Performing Services Lookup

ServicesLookup is used to find a service and its properties. It determines what topics or services are available on the ISE peer node that publishes these topics. Examples of these topics are Session Directory, RADIUS failures, MDM, Profiler Configuration, System Health, TrustSec, TrustSec Configuration and TrustSec SXP. For more information, please see: <https://github.com/cisco-pxgrid/pxgrid-rest-ws/wiki/pxGrid-Consumer>

In the case of publishing Internet of Things (IOT) asset devices, this will return the services of the pxGrid client publishing the asset topic.

In this example, we are interested in seeing which node publishes the session information.

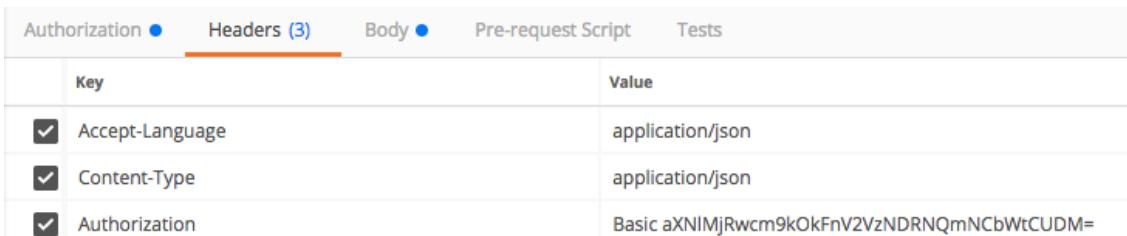

Step 1 Run Service Lookup, to see what services are available on all the ISE nodes

A screenshot of a POST request in a browser. The method is "POST" and the URL is "https://ise24fc2.lab10.com:8910/pxgrid/control/ServiceLookup".

Step 2 The Headers should read:

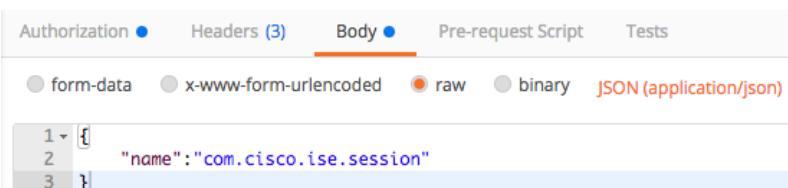

Note: The Authorization header should be the username and password from step 8, when creating the account

A screenshot of the Postman Headers tab. The "Headers (3)" tab is selected. The table shows three headers: "Accept-Language" with value "application/json", "Content-Type" with value "application/json", and "Authorization" with value "Basic aXNIMjRwcm9kOkFnV2VzNDRNQmNCbWtCUDM=". The "Authorization" header is highlighted with a blue dot.

Key	Value
Accept-Language	application/json
Content-Type	application/json
Authorization	Basic aXNIMjRwcm9kOkFnV2VzNDRNQmNCbWtCUDM=

Step 3 We request session topic which can be found here: <https://github.com/cisco-pxgrid/pxgrid-rest-ws/wiki/Session-Directory>

A screenshot of the Postman Body tab. The "Body (1)" tab is selected. The "raw" radio button is selected. The JSON payload is: { "name": "com.cisco.ise.session"}

```
1 [ {  
2   "name": "com.cisco.ise.session"  
3 } ]
```

Step 4 Note the nodeName or the ISE node that publishes the session information and the properties JSON example:

```

1  [
2   "services": [
3     {
4       "name": "com.cisco.ise.session",
5       "nodeName": "ise-mnt-ise24fc2",
6       "properties": {
7         "sessionTopic": "/topic/com.cisco.ise.session",
8         "groupTopic": "/topic/com.cisco.ise.session.group",
9         "wsPubsubService": "com.cisco.ise.pubsub",
10        "restBaseUrl": "https://ise24fc2.lab10.com:8910/pxgrid/mnt/sd",
11        "restBaseUrl": "https://ise24fc2.lab10.com:8910/pxgrid/mnt/sd"
12      }
13    }
14  ]
15 ]

```

The **sessionTopic** “/topic/com.cisco.ise.session” contains the session attributes of the authenticated endpoint. The **restBaseUrl** <https://ise24fc2.lab10.com:8910/pxgrid/mnt/sd> will be used later on in the REST Client request to get all authenticated sessions.

The **wsPubsubService** “com.cisco.ise.pubsub” contains the WebSockets published service.

Obtaining the Access Secret

The Access Secret provides HTTP Basic Auth access to the ISE node that will publish the session information. This will be used in the REST Client API to obtain session information when querying based on an IP address.

Step 1 Obtain access secret

Step 2 The Headers are as follows

Authorization		Headers (3)	Body	Pre-request Script	Tests
	Key		Value		
<input checked="" type="checkbox"/>	Accept		application/json		
<input checked="" type="checkbox"/>	Content-Type		application/json		
<input checked="" type="checkbox"/>	Authorization		Basic aXNIMjRwcm9kOkFnV2VzNDRNQmNCbWtCUDM=		

Step 3 Specify the ISE node that will publish the session information as provided by the returned service lookup results.

```

1 [{}]
2 "peerNodeName": "ise-mnt-ise24fc2"
3 }
  
```

Step 4 The access secret is returned below:

```

1 [{}]
2 "secret": "Pe874IdYp4RsNpmv"
3 }
  
```

Run GetSessionByIpAddress WebSockets REST API Script

The Get Session By IP RESTAPI returns available session information from an IP address query. For more information please see: <https://github.com/cisco-pxgrid/pxgrid-rest-ws/wiki/Session-Directory>

Step 1 Run the getSessionByIpAddress REST API script below:

POST <https://ise24fc2.lab10.com:8910/pxgrid/mnt/sd/getSessionByIpAddress>

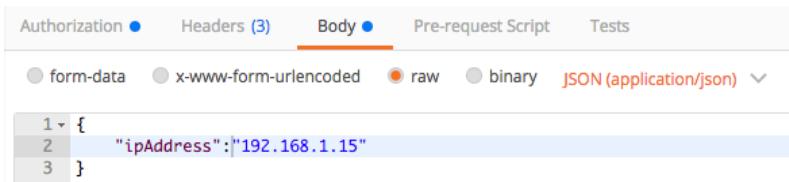

Note that the **restBaseUrl** <https://ise24fc2.lab10.com:8910/pxgrid/mnt/sd> is used in the script

Step 2 Please use the following header information

Note: The authorization header contains the username from step 8, creating the initial account, and the password contains the access secret password

Key	Value
Accept-Language	application/json
Content-Type	application/json
Authorization	Basic aXNIMjRwcm9kOjZadTVjcXdXcEhMWDZ1OG8=

Step 3 Submit the IP address you want to perform a query action on

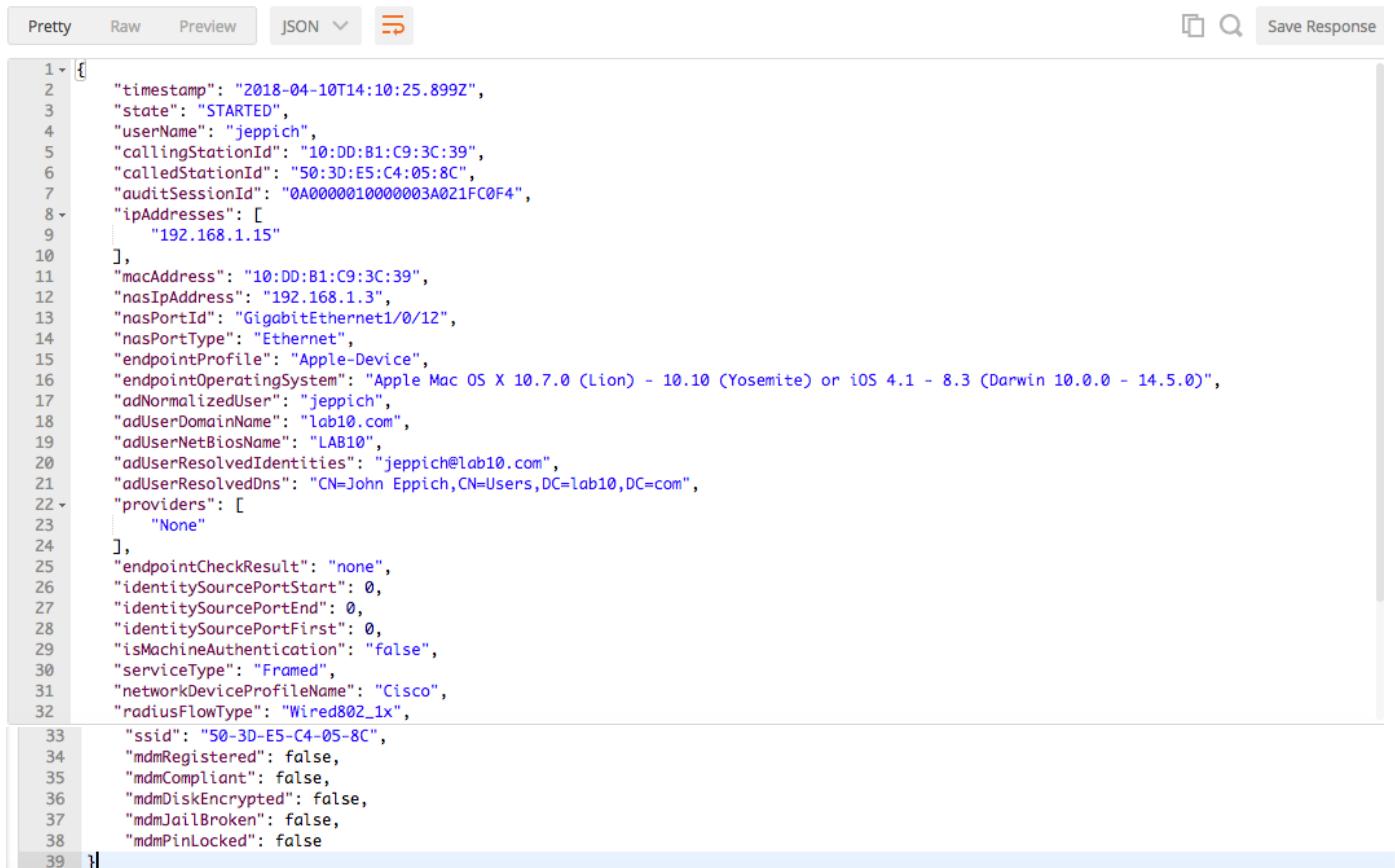

The screenshot shows the Postman interface with the 'Body' tab selected. The raw JSON input is:

```

1 {
2   "ipAddress": "192.168.1.15"
3 }

```

Step 4 Below are the returned session attributes for the endpoint IP address of 192.168.1.15

```

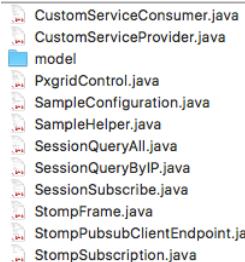

1 {
2   "timestamp": "2018-04-10T14:10:25.899Z",
3   "state": "STARTED",
4   "userName": "jeppich",
5   "callingStationId": "10:DD:B1:C9:3C:39",
6   "calledStationId": "50:3D:E5:C4:05:8C",
7   "auditSessionId": "0A0000010000003A021FC0F4",
8   "ipAddresses": [
9     "192.168.1.15"
10  ],
11  "macAddress": "10:DD:B1:C9:3C:39",
12  "nasIpAddress": "192.168.1.3",
13  "nasPortId": "GigabitEthernet1/0/12",
14  "nasPortType": "Ethernet",
15  "endpointProfile": "Apple-Device",
16  "endpointOperatingSystem": "Apple Mac OS X 10.7.0 (Lion) - 10.10 (Yosemite) or iOS 4.1 - 8.3 (Darwin 10.0.0 - 14.5.0)",
17  "adNormalizedUser": "jeppich",
18  "adUserDomainName": "lab10.com",
19  "adUserNetBiosName": "LAB10",
20  "adUserResolvedIdentities": "jeppich@lab10.com",
21  "adUserResolvedDns": "CN=John Eppich,CN=Users,DC=lab10,DC=com",
22  "providers": [
23    "None"
24  ],
25  "endpointCheckResult": "none",
26  "identitySourcePortStart": 0,
27  "identitySourcePortEnd": 0,
28  "identitySourcePortFirst": 0,
29  "isMachineAuthentication": "false",
30  "serviceType": "Framed",
31  "networkDeviceProfileName": "Cisco",
32  "radiusFlowType": "Wired802_1x",
33  "ssid": "50-3D-E5-C4-05-8C",
34  "mdmRegistered": false,
35  "mdmCompliant": false,
36  "mdmDiskEncrypted": false,
37  "mdmJailBroken": false,
38  "mdmPinLocked": false
39 }

```

Java Code Examples

You can download Java code examples once registered to Cisco Devnet www.cisco.com/go/pxgridpartner from <https://github.com/cisco-pxgrid/pxgrid-rest-ws>

The code samples are as follows:

For this example, we will run the SessionSubscribe.java code, to see the available contextual information from an authenticated user session.

You can also develop code to subscribe and obtain contextual information from other topics: Radius Failure, these topics are Session Directory, RADIUS failures, MDM, Profiler Configuration, System Health, TrustSec, TrustSec Configuration and TrustSec SXP. For more information, please see: <https://github.com/cisco-pxgrid/pxgrid-rest-ws/wiki/pxGrid-Consumer>

First, we will need to create certificates your system, which will be the pxGrid client. The pxGrid client will authenticate to the ISE pxGrid node using certificates or pre-shared keys, in this example we will use certificates generated from the ISE internal Certificate Authority (CA).

Generating pxGrid client Certificates from ISE Internal CA

In this example, we will create the pxGrid client certificate in PKCS12 format. You will also want to test in PEM format, when you go for your pxGrid certification.

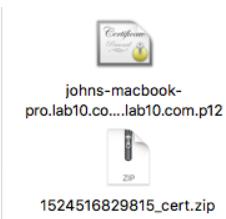

Step 1 Select Administration->pxGrid Services->Certificates-> provide the following information

Note: CN name should be Fully Qualified Domain Name (FQDN) resolvable. PKCS12 format is not supported using Python libraries.

Step 2 Select Create

Step 3 Download the zipped file

You should see:

**Step 4** Note, if using PEM format, when you unzip the file you will see the following:

Note: Please refer to <https://communities.cisco.com/docs/DOC-71928>, using iSE 2.2 Internal CA to deploy to pxGrid clients (java keystores), for Productional ISE deployments, please refer to: <https://communities.cisco.com/docs/DOC-68284>

Converting Certificates to JKS format

The PKCS12 certificate is converted into the keystore filename and truststore filename.

```
openssl pkcs12 -export -out session.p12 -inkey Johns-Macbook-Pro.lab10.com_Johns-Macook-Pro.lab10.com.key -in Johns-Macbook-Pro.lab10.com_Johns-Macook-Pro.lab10.com.cer -chain -CAfile CA1.cer
Enter pass phrase for Johns-Macbook-Pro.lab10.com_Johns-Macook-Pro.lab10.com.key:
Enter Export Password: Cisco123
Verifying - Enter Export Password: Cisco123

keytool -importkeystore -srckeystore session.p12 -destkeystore session1.jks -srcstoretype PKCS12
Enter destination keystore password: Cisco123
Re-enter new password: Cisco123
Enter source keystore password: Cisco123
Entry for alias 1 successfully imported.
Import command completed: 1 entries successfully imported, 0 entries failed or cancelled

openssl x509 -outform der -in CA1.cer -out CA1.der
keytool -import -alias session1 -keystore rootsession.jks -file CA1.der
Enter keystore password: Cisco123
Re-enter new password: Cisco123
Owner: CN=Certificate Services Endpoint Sub CA - ise24fc3
Issuer: CN=Certificate Services Node CA - ise24fc3
Serial number: 589713fe8d1d4c99b580aae99e862c4f

Downloading Java Examples

In this section, java code examples are downloaded and imported into an Eclipse project

Step 1 Register for devnet: www.cisco.com/go/pxgridpartner

Step 2 Open browser to <https://github.com/cisco-pxgrid/pxgrid-rest-ws>

cisco-pxgrid / pxgrid-rest-ws

Code Issues Pull requests Projects Wiki Insights

Cisco pxGrid with REST and WebSocket

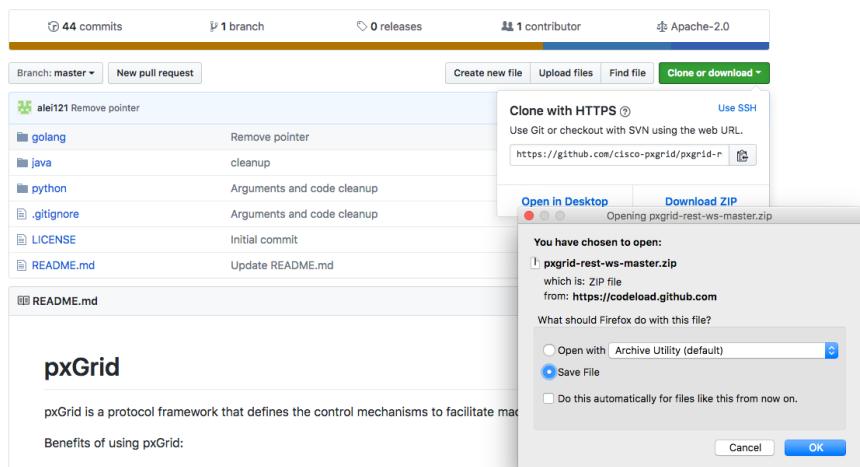

44 commits 1 branch 0 releases 1 contributor Apache-2.0

Branch: master New pull request Create new file Upload files Find file Clone or download

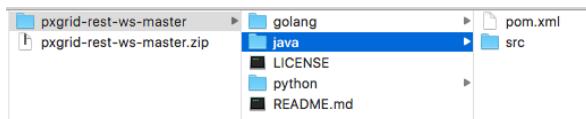

alei121 Remove pointer	Latest commit f56eea7 7 days ago
golang	Remove pointer
java	cleanup
python	Arguments and code cleanup
.gitignore	Arguments and code cleanup
LICENSE	Initial commit
README.md	Update README.md
README.md	

Step 3 Download the zipped file and save locally

Cisco pxGrid with REST and WebSocket

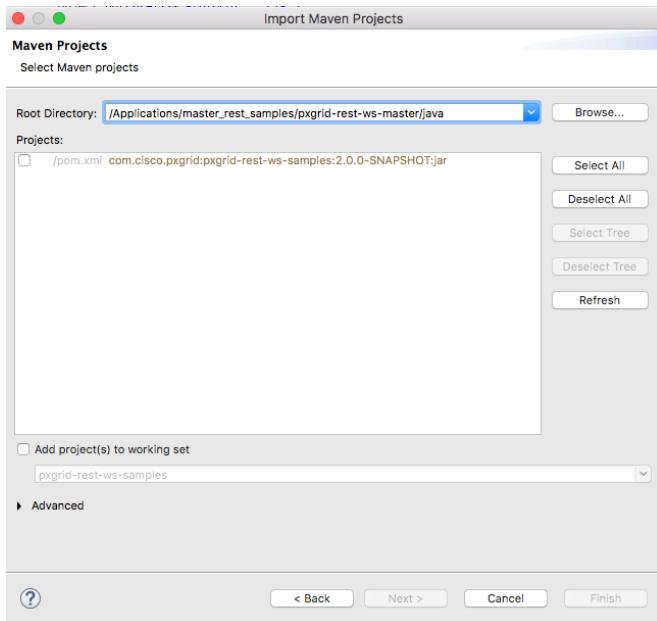

- Step 4** Unzip the file
 You should see:

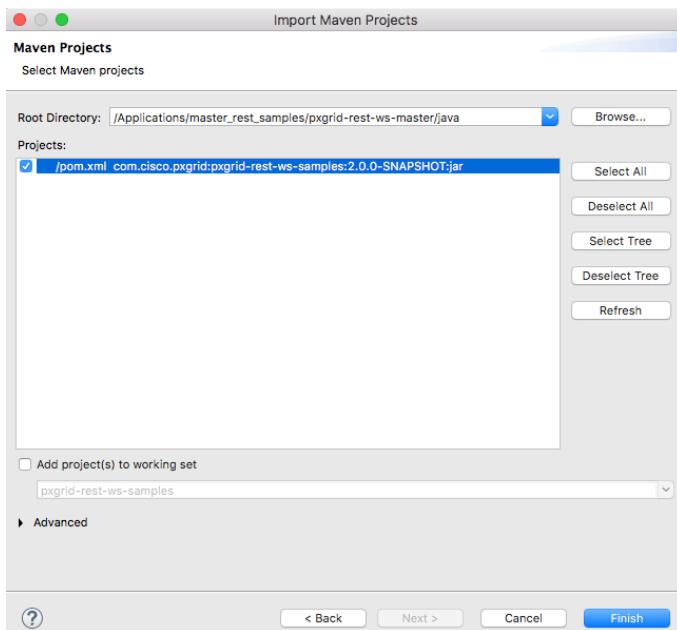

- Step 5** Select **File->Import->Maven->Existing Maven Projects**
Step 6 Select **Next->enter root directory where the POM file is located**

Note: The POM.xml file will be enabled

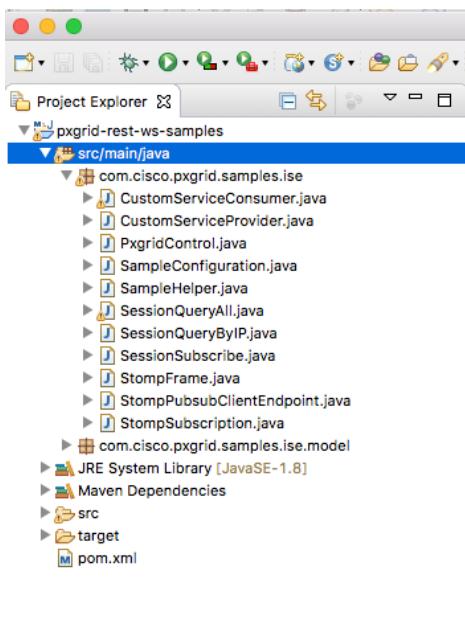

- Step 7** Highlight the snapshot.jar file

**Step 8** Select **Finish**

Step 9 You should see the imported jar file and the following samples:

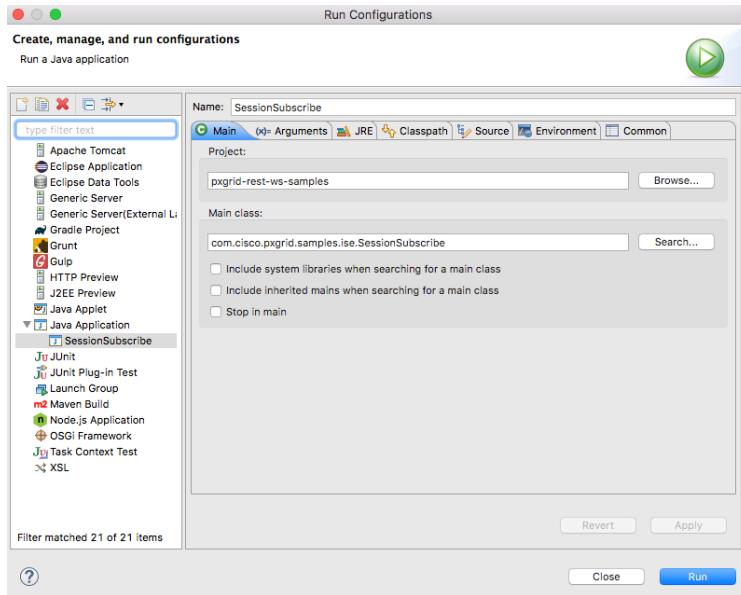

Note: If you do not see the scripts, select Run->Run As->Maven Clean

SessionSubscribe Coding Example

This is a common example of subscribing to the session directory service and receiving incoming session notifications in real-time

- Step 1** Under **com.cisco.pxgrid.samples.ise->SessionSubscribe**, Right-Click on “mainStringID:void->Run As->Run Configurations
You will see

- Step 2** Select (x) **Arguments**, and enter the following:

Note: The keystorefile name, keystorepassword, truststore filename and truststore password are from the earlier step in generating certificates.

```
-a ise24fc3.lab10.com -u mac03 -k /Applications/master_rest_samples/session1.jks -p Cisco123 -t /Applications/master_rest_samples/rootsession.jks -q Cisco123
```

where the argument usage is:

```
usage: SessionSubscribe
-a,--hostname <arg>          Host name (multiple accepted)
-d,--description <arg>        Description (optional)
-k,--keystorefilename <arg>   Keystore .jks filename (not required if
                                password is specified)
-p,--keystorepassword <arg>   Keystore password (not required if
                                password is specified)
-q,--truststorepassword <arg> Truststore password
-t,--truststorefilename <arg> Truststore .jks filename
-u,--nodename <arg>          Node name
-w,--password <arg>          Password (not required if keystore is
                                specified)
```

- Step 3** Select **Apply**

- Step 4** Select **Run**

- Step 5** If you have active user authenticated sessions coming in, you will see the following

```
----- config -----
```

```

hostname = ise24fc3.lab10.com
nodename = mac03
password = (not specified)
description = (not specified)
keystorefilename = /Applications/master_rest_samples/session1.jks
keystorepassword = Cisco123
truststorefilename = /Applications/master_rest_samples/rootsession.jks
truststorepassword = Cisco123

Step 6 Select Operations->RADIUS->Live Logs, to see the authenticated endpoints in ISE.

The screenshot shows the Cisco Identity Services Engine (ISE) Operations > RADIUS > Live Logs interface. At the top, there are several status indicators and a search bar. Below the header, there are four summary counters: Misconfigured Suplicants (0), Misconfigured Network Devices (0), RADIUS Drops (0), and Client Stopped Responding (0). A Repeat Counter shows a value of 4. The main area displays a table of RADIUS event logs. The columns include Time, Status, Details, Repeat..., Identity, Endpoint ID, Endpoint P..., Authenticat..., Authorizat..., Authorizat..., IP Address, and Network. The table lists various entries from April 16, 2018, such as successful logins for users jeppich and LAB10\pxgrid5, along with their respective endpoint details and network locations.

Time	Status	Details	Repeat...	Identity	Endpoint ID	Endpoint P...	Authenticat...	Authorizat...	Authorizat...	IP Address	Network

StompFrame

This code represents the parsing of STOMP frames.

```

package com.cisco.pxgrid.samples.ise;

import java.io.IOException;
import java.io.InputStream;
import java.io.OutputStream;
import java.text.ParseException;
import java.util.HashMap;
import java.util.Map;

/**
 * This follows STOMP 1.2 specification to parse and generate STOMP frames:
 * https://stomp.github.io/stomp-specification-1.2.html
 *
 * This single class is self-sufficient handle all STOMP frames.
 *
 * Note for WebSocket:
 * If input comes as WebSocket text type, (WS RFC says Text is UTF-8)
 * server side handling code like Spring TextMessage may convert the bytes to String as UTF-8
 */

```

```
* which maybe the wrong encoding as STOMP frame itself can use other encoding.
* e.g. A particular encoding may have bytes: FF FF FF FF FF FF FF FF FF FF... 10, that is completely out
of range for Unicode.
* Unless STOMP body is also UTF-8, STOMP frame must be sent as binary
*

        String id = SampleHelper.prompt("Operation ID: ");
        getOperationStatus(config, id);
    }
}
```

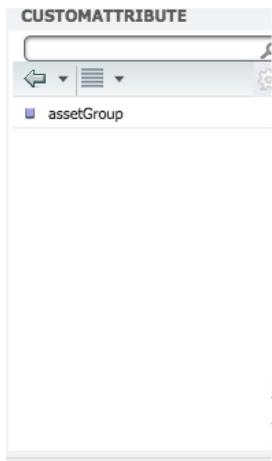

Cisco pxGrid Context-In

Cisco pxGrid Context-in provides ecosystem partners to publish device or endpoint asset context attributes into ISE based on the pxGrid client publishing to the asset topic or asset service, /topic/com.cisco.endpoint.asset. ISE will subscribe to this /topic/com.cisco.endpoint.asset topic. An ISE profiling policy will be created using these asset attributes. This ISE profile will be assigned an ISE logical profile to be used in an ISE authorization policy to provide secure network access for the device or endpoint asset. Custom attributes can also be defined in a profiling policy and can be used in an ISE authorization policy as well.

These attributes include: assetID, assetName, assetIpAddress, assetMacAddress, assetVendor, assetProductId, assetSerialNumber, assetDeviceType, assetSwRevision, assetHwRevision, assetProtocol and are defined in the IOT Assets profiling dictionary when creating the Asset's profiling policy. The asset attribute values are defined by the ecosystem partner in the custompublisher.java code. The API_Simulator Code listing is provided in the *API_Simulator* Context-In section.

If the ecosystem partner has custom attributes that are not defined in the IOT Assets profiling dictionary, these can also be published. These custom attributes are defined in JSON array in the custompublisher.java code. These are also defined in the Custom Attributes profiling policies and defined in the ISE Identity Custom endpoint settings.

The Cisco ISE pxGrid node controller becomes the subscriber to the endpoint Asset topic and consumes this information.

Client Name	Connect To	Session Id	Certificate	Subscriptions	Publications	IP Address	Status	Start time

Enabling pxGrid as Subscriber for Profiling

Step 1 Select Administrator->System->Deployment>the ISE node->Edit the node->Profiling Configuration
Step 2 Enable pxGrid

pxGrid

Description: The PXgrid probe to fetch attributes of MAC or IP-Address as a subscriber from PXGrid

Step 3 Select Save

Step 4 Select Administrator->pxGrid Services->Web Clients

Note: The ISE admin node has subscribed to the endpoint asset topic

Client Name	Connect To	Session Id	Certificate	Subscriptions	Publications	IP Address

Running API_Simulator

The API Simulator is a tool that is used to provide pxGrid context-in simulating a pxGrid client asset device-publishing asset attributes to the ISE pxgrid node.

The *./run_publisher38* script contains the command-line arguments to run the simulator, this also provides the access secret between the publisher and ISE pxGrid node to begin publishing content from the asset device or client endpoint in the script.

If you desire to modify the existing attributes in the script you must modify the custompublisher.java code. An example is provided using Maven.

A profiling policy will be created based on the asset attribute values from the client device. The profiling policy will then be assigned a Logical Profile that can be assigned in an ISE authorization condition rule that can be used in an ISE authorization policy to determine network access for the asset device. We will also illustrate the same example using custom attributes.

Step 1 Extract the contents of the API Simulator to a folder

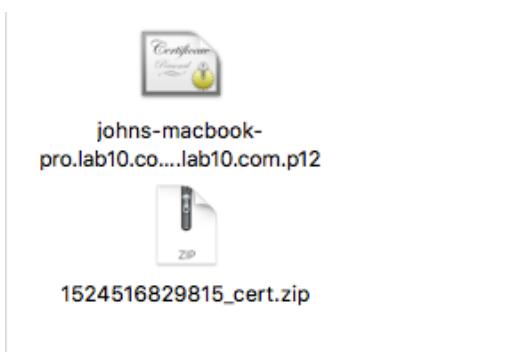

Step 2 Create a PKCS12 certificate from **ISE->Administration->pxGrid Services->Certificates** and provide the following information:

Note: CN name should be Fully Qualified Domain Name (FQDN) resolvable. PKCS12 format is not supported using Python libraries.

Step 3 Select **Create**

Download the zipped file

You should see:

**Step 5** Edit the */run_publisher38.sh* file:

where:

- DPXGRID_HOSTNAMES= ISE pxGrid node (i.e. ise24fc3.lab10.com)
- DPXGRID_USERNAME= pxGrid client name (i.e. IOT1)
- DPXGRID_GROUP= pxGrid client group (i.e. Session)
- DPXGRID_KEYSTORE_FILENAME= client keystore file (i.e. Johns-Macbook-Pro.lab10.com_Johns-Macbook-Pro.lab10.com.p12)
- DPXGRID_KEYSTORE_PASSWORD=client keystore file password (i.e. Cisco123)
- DPXGRID_TRUSTSTORE_FILENAME= truststore or root keystore files (i.e. Johns-Macbook-Pro.lab10.com_Johns-Macbook-Pro.lab10.com.p12)
- DPXGRID_KEYSTORE_PASSWORD=truststore or root keystore file password (i.e. Cisco123)

```
java -jar -DPXGRID_HOSTNAMES="ise24fc3.lab10.com" -DPXGRID_USERNAME="IOT1" -DPXGRID_GROUP="Session" -DPXGRID_KEYSTORE_FILENAME="Johns-Macbook-Pro.lab10.com_Johns-Macbook-Pro.lab10.com.p12" -DPXGRID_KEYSTORE_PASSWORD="Cisco123" -DPXGRID_TRUSTSTORE_FILENAME="Johns-Macbook-Pro.lab10.com_Johns-Macbook-Pro.lab10.com.p12" -DPXGRID_TRUSTSTORE_PASSWORD="Cisco123" pxgrid-rest-ws-samples-2.0.0-SNAPSHOT.jar
```

Step 6 Type: `./run_publisher38.sh`, you will see the following:

```

  .\\ /___.|-__|_(-)_-__\__-\\__\\__\\
  ( )\\__|_|_)|-|_|-|_|(|_)|_) ) ) )
  ======|_|=====|_|=/_/_/_/

```

Viewing Asset Device in Context Visibility Screen

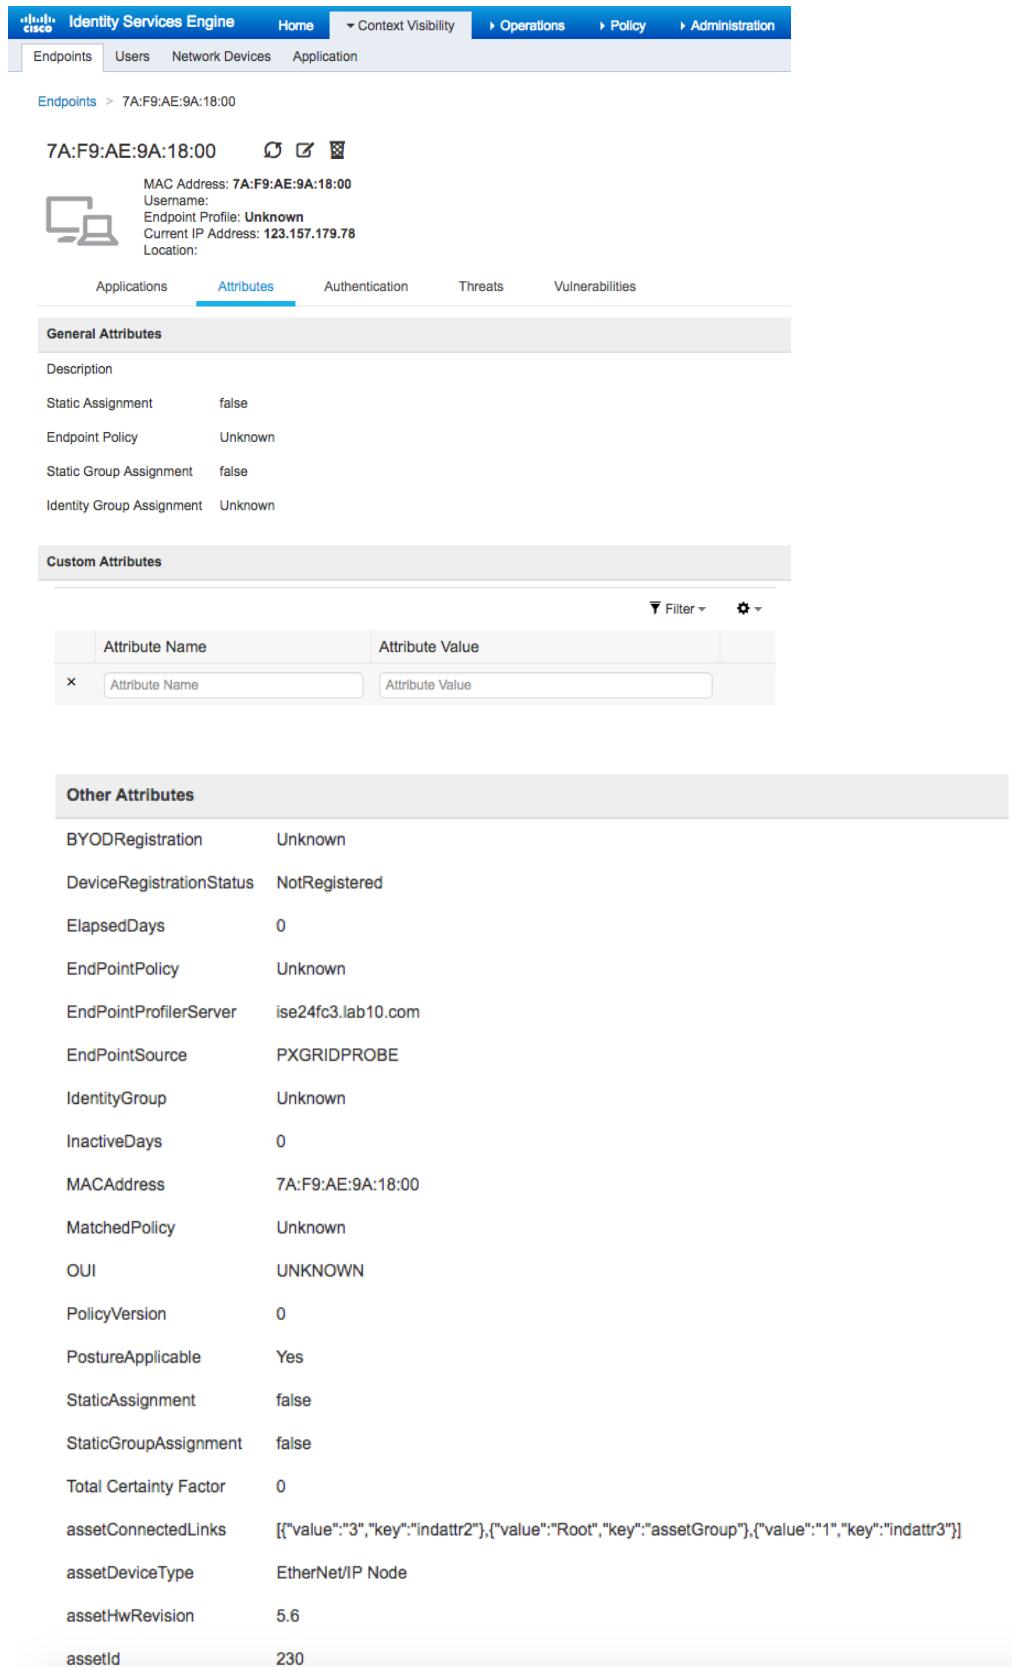

Step 1 Select Context Visibility->Endpoints->Endpoint Classification

You will see the client endpoint generated from the script as determined by the MAC address and the client IP address.

Note: if you do not see the endpoint, verify that the ISE admin node has subscribed to the endpoint asset topic. If the ISE Admin node has not subscribed to the ISE endpoint asset topic, ensure that pxGrid is enabled for Profiling under Administration->System->Deployment->edit the node and select Profiling Configuration.

MAC Address	Anomalous...	IPv4 Address	Username	Hostname	Location	Endpoint Profile	Description	OUI	OS Types
7A:F9:AE:9A:18:00		123.157.179.78		Unknown	Unknown	Unknown	UNKNOWN	UNKNOWN	UNKNOWN

Step 2 Click on the **MAC address**, and select **Attributes**, you will see the attributes:

The screenshot shows the Cisco Identity Services Engine (ISE) web interface. The top navigation bar includes links for Home, Context Visibility, Operations, Policy, and Administration. Below the navigation is a secondary menu with Endpoints, Users, Network Devices, and Application. The main content area shows the selected endpoint's details: MAC Address: 7A:F9:AE:9A:18:00, Username: (empty), Endpoint Profile: Unknown, Current IP Address: 123.157.179.78, and Location: (empty). Below this, there are tabs for Applications, Attributes (which is selected and highlighted in blue), Authentication, Threats, and Vulnerabilities. The Attributes section is divided into three tabs: General Attributes, Custom Attributes, and Other Attributes.

General Attributes

Description	
Static Assignment	false
Endpoint Policy	Unknown
Static Group Assignment	false
Identity Group Assignment	Unknown

Custom Attributes

Attribute Name	Attribute Value
(empty)	(empty)

Other Attributes

BYODRegistration	Unknown
DeviceRegistrationStatus	NotRegistered
ElapsedDays	0
EndPointPolicy	Unknown
EndPointProfilerServer	ise24fc3.lab10.com
EndPointSource	PXGRIDPROBE
IdentityGroup	Unknown
InactiveDays	0
MACAddress	7A:F9:AE:9A:18:00
MatchedPolicy	Unknown
OUI	UNKNOWN
PolicyVersion	0
PostureApplicable	Yes
StaticAssignment	false
StaticGroupAssignment	false
Total Certainty Factor	0
assetConnectedLinks	[{"value": "3", "key": "indattr2"}, {"value": "Root", "key": "assetGroup"}, {"value": "1", "key": "indattr3"}]
assetDeviceType	EtherNet/IP Node
assetHwRevision	5.6
assetId	230

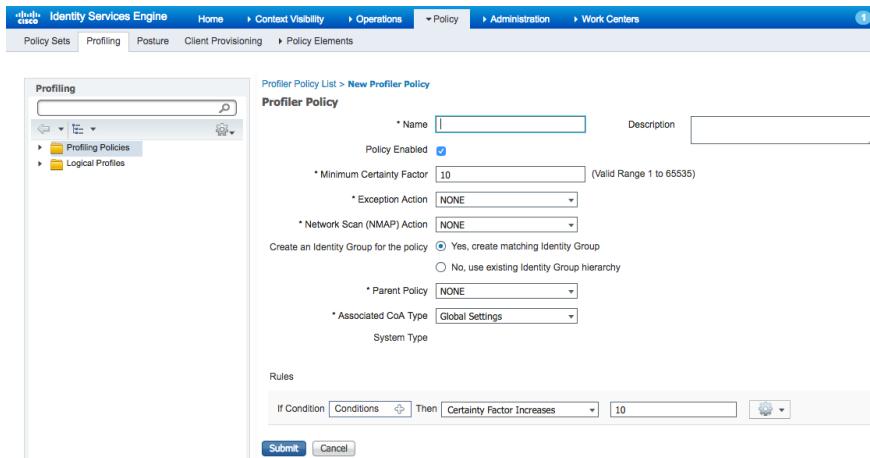

assetIpAddress	123.157.179.78
assetMacAddress	7a:f9:ae:9a:18:00
assetName	Abjergaryn - 45
assetProductId	IE2000
assetProtocol	CIP
assetSerialNumber	1212121213243
assetSwRevision	4.6
assetVendor	Cisco Systems
ip	123.157.179.78

Creating Profiling Policy Based on Asset Attributes

In this example, we define an IOT_Example1 profiling policy based on the attribute values of the client or asset device. These attribute values are mapped to the IOTASSETS dictionary attributes to define the policy. This profiling policy will then be assigned to an IOTDevices1 logical profile. This logical profile can then be added as an ISE authorization condition rule to be used in an ISE authorization policy to determine the asset's network access. A security group tag of IOT devices will also be created and added to the ISE authorization policy.

Note: When running the script, you will not see the RADIUS events that trigger this rule, since the script simulates endpoint. However, when you implement the code and test in your environment, this rule will be triggered.

Step 1 Select Policy->Profiling->Profiling Policies->Add
 You will see the following:

- Step 2** Enter: **IOT_Example1** for Name
Step 3 Under **Rules->If Condition->Create New Condition (Advanced Option)**
Step 4 Under **Expression->Select Attribute->Iotas set**
Step 5 You should see:

Profiler Policy List > New Profiler Policy

Profiler Policy

* Name	IOT_Example1	Description	
Policy Enabled	<input checked="" type="checkbox"/>		
* Minimum Certainty Factor	10		
* Exception Action	NONE		
* Network Scan (NMAP) Action	NONE		
Create an Identity Group for the policy	<input checked="" type="radio"/> Yes, create matching Identity Group <input type="radio"/> No, use existing Identity Group hierarchy		
* Parent Policy	NONE		
* Associated CoA Type	Global Settings		
System Type			
Rules			
If Condition	Select_Attribute__	Then	Certainty Factor Increases
Condition Name: Select_Attribute Expression: Select Attribute			

IOTASSET

assetDeviceType
assetHwRevision
assetId
assetIpAddress
assetMacAddress
assetName
assetProductId
assetProtocol
assetSerialNumber
assetSwRevision
assetVendor

Submit **Cancel**

Step 6 Select assetDeviceType:contains:EtherNetVIP Node, enter, increase certainty factor to 100
Step 7 Select “Gear”->“Insert line below”

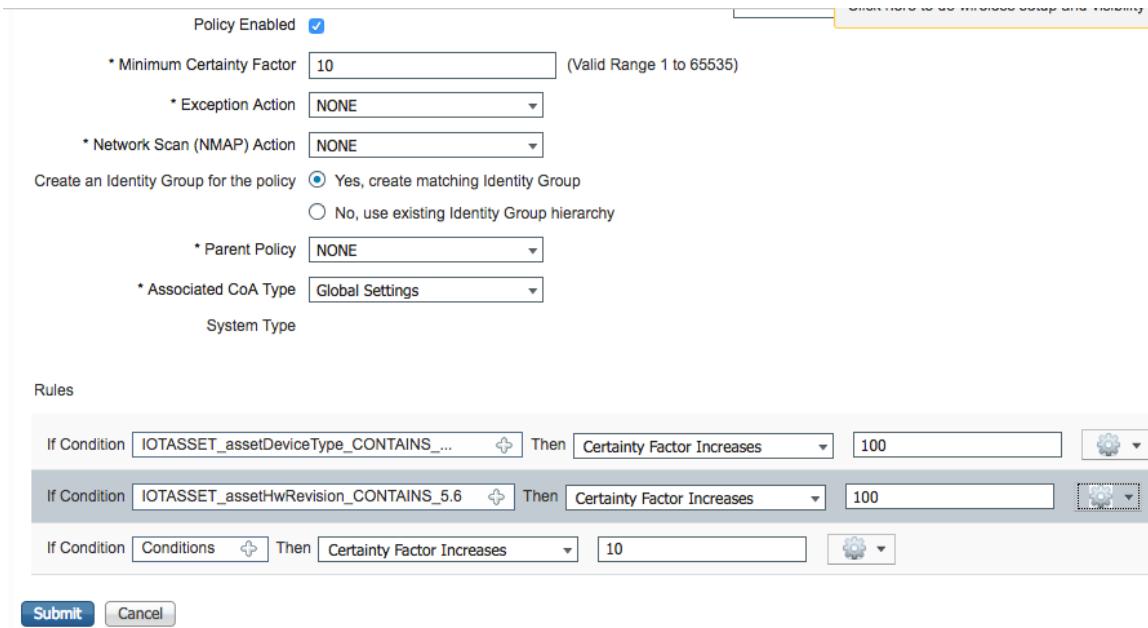

Profiler Policy List > New Profiler Policy

Profiler Policy

* Name	IOT_Example1	Description	
Policy Enabled	<input checked="" type="checkbox"/>		
* Minimum Certainty Factor	10	(Valid Range 1 to 65535)	
* Exception Action	NONE		
* Network Scan (NMAP) Action	NONE		
Create an Identity Group for the policy	<input checked="" type="radio"/> Yes, create matching Identity Group <input type="radio"/> No, use existing Identity Group hierarchy		
* Parent Policy	NONE		
* Associated CoA Type	Global Settings		
System Type			
Rules			
If Condition	IOTASSET_assetDeviceType_CONTAINS__	Then	Certainty Factor Increases 100
If Condition	Select_Attribute__	Then	Certainty Factor Increases 10

Submit **Cancel**

Step 8 Under **Rules->If Condition->Create New Condition(Advanced Option)**
Step 9 Under **Expression->Select Attribute->IOTAsset**
Step 10 Select assetHwRevision:contains:5.6, enter, increase certainty factor to 100
Step 11 Select “Gear”->“Insert line below”
Step 12 You should see:

The screenshot shows the configuration interface for a security policy. At the top, there's a section for 'Policy Enabled' with a checked checkbox. Below it are fields for 'Minimum Certainty Factor' (set to 10), 'Exception Action' (set to 'NONE'), and 'Network Scan (NMAP) Action' (set to 'NONE'). A section for 'Create an Identity Group for the policy' includes two radio button options: 'Yes, create matching Identity Group' (selected) and 'No, use existing Identity Group hierarchy'. There are also dropdowns for 'Parent Policy' (set to 'NONE') and 'Associated CoA Type' (set to 'Global Settings'). Under 'System Type', there's a 'Rules' section containing three if-then statements:

- If Condition: IOTASSET_assetDeviceType_CONTAINS_... Then: Certainty Factor Increases by 100.
- If Condition: IOTASSET_assetHwRevision_CONTAINS_5.6 Then: Certainty Factor Increases by 100.
- If Condition: Conditions Then: Certainty Factor Increases by 10.

At the bottom of the interface are 'Submit' and 'Cancel' buttons.

- Step 13** Under **Rules->If Condition->Create New Condition(Advanced Option)**
Step 14 Under **Expression->Select Attribute->IOT Asset**
Step 15 Select **assetId:contains:230**, enter, increase certainty factor to 100
Step 16 Select “Gear”->”Insert line below”
Step 17 Under **Rules->If Condition->Create New Condition(Advanced Option)**
Step 18 Under **Expression->Select Attribute->IOT Asset**
Step 19 Select **assetIpAddress:contains:123.157.78.79**, enter, increase certainty factor to 100
Step 20 Select “Gear”->”Insert line below”
Step 21 Under **Rules->If Condition->Create New Condition(Advanced Option)**
Step 22 Under **Expression->Select Attribute->IOT Asset**
Step 23 Select **assetMacAddress:contains:78:f9:ae:9a:18:00**, enter, increase certainty factor to 100
Step 24 Select “Gear”->”Insert line below”
Step 25 Under **Rules->If Condition->Create New Condition(Advanced Option)**
Step 26 Under **Expression->Select Attribute->IOT Asset**
Step 27 Select **assetId:contains:230**, enter, increase certainty factor to 100
Step 28 Select “Gear”->”Insert line below”
Step 29 Under **Rules->If Condition->Create New Condition(Advanced Option)**
Step 30 Under **Expression->Select Attribute->IOT Asset**
Step 31 Select **assetName:contains:Abjergaryn - 45**, enter, increase certainty factor to 100
Step 32 Select “Gear”->”Insert line below”
Step 33 Under **Rules->If Condition->Create New Condition(Advanced Option)**
Step 34 Under **Expression->Select Attribute->IOT Asset**
Step 35 Select **assetProductId:contains:IE2000**, enter, increase certainty factor to 100
Step 36 Select “Gear”->”Insert line below”
Step 37 Under **Rules->If Condition->Create New Condition(Advanced Option)**
Step 38 Under **Expression->Select Attribute->IOT Asset**
Step 39 Select **assetProtocol:contains:CIP**, enter, increase certainty factor to 100
Step 40 Select “Gear”->”Insert line below”
Step 41 Under **Rules->If Condition->Create New Condition(Advanced Option)**

- Step 42** Under **Expression->Select Attribute->IOT Asset**
- Step 43** Select assetSerialNumber:contains: 1212121213243, enter, increase certainty factor to 100
- Step 44** Select “Gear”->”Insert line below
- Step 45** Under **Rules->If Condition->Create New Condition(Advanced Option)**
- Step 46** Under **Expression->Select Attribute->IOT Asset**
- Step 47** Select assetSwRevision:contains:4.6, enter, increase certainty factor to 100
- Step 48** Select “Gear”->”Insert line below
- Step 49** Under **Rules->If Condition->Create New Condition(Advanced Option)**
- Step 50** Under **Expression->Select Attribute->IOT Asset**
- Step 51** Select assetVendor:contains:Cisco Systems, enter, increase certainty factor to 100
- Step 52** Select “Gear”->”Insert line below
- Step 53** You should see the following

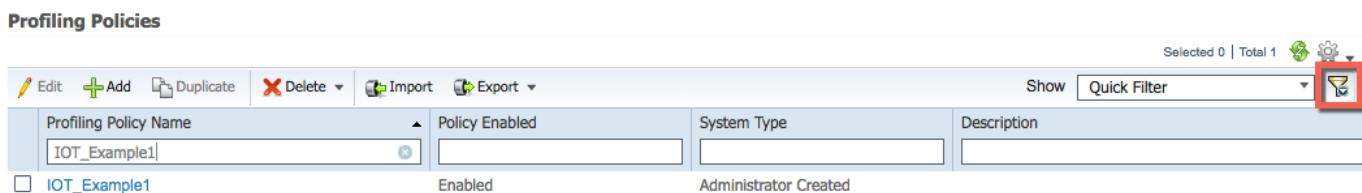

Rules

If Condition	IOTASSET_assetIpAddress_CONTAINS_4...	Then	Certainty Factor Increases	100	
If Condition	IOTASSET_assetMacAddress_CONTAINS...	Then	Certainty Factor Increases	100	
If Condition	IOTASSET_assetName_CONTAINS_Abjer...	Then	Certainty Factor Increases	100	
If Condition	IOTASSET_assetProductId_CONTAINS_1E...	Then	Certainty Factor Increases	100	
If Condition	IOTASSET_assetProtocol_CONTAINS_CIP	Then	Certainty Factor Increases	100	
If Condition	IOTASSET_assetSerialNumber_CONTAIN...	Then	Certainty Factor Increases	100	
If Condition	IOTASSET_assetSwRevision_CONTAINS_4.6	Then	Certainty Factor Increases	100	
If Condition	IOTASSET_assetVendor_CONTAINS_Cisc...	Then	Certainty Factor Increases	100	

- Step 54** Select **Submit**

Step 55 Select Funnel, enter **IOT_Example1** under the **Profiling Policy Name**, you should see:

Profiling Policies

Profiling Policy Name	Policy Enabled	System Type	Description
IOT_Example1	Enabled	Administrator Created	

- Step 56** Add IOT_Example1 to Logical Profile

Select **Profiling->Logical Profiles->Add->Name: IOT1Devices->Policy Assignment->Available Policies->IOT_Example1 and move to Assigned Policies**

Logical Profile

- Name: IOTDevices
- Description: (empty)
- Policy Assignment:
 - Available Policies: 2Wire-Device, 3Com-Device, Aastra-Device, Aastra-IP-Phone, Aerohive-Access-Point, Aerohive-Device, American-Power-Conversion-Device, Android
 - Assigned Policies: IOT_Example1

Submit **Cancel**

Step 57 Select Submit

Step 58 You should see the logical profile IOTDevices

Logical Profiles	System Type	Description
Cameras	Cisco Provided	Default logical profile for cameras.
Gaming Devices	Cisco Provided	Default logical profile for gaming devices.
Home Network Devices	Cisco Provided	Default logical profile for home network devices.
IOTDevices	Administrator Created	
IP-Phones	Cisco Provided	Default logical profile for IP Phones.
Infrastructure Network Devices	Cisco Provided	Default logical profile for infrastructure network devices.
Medical Devices	Cisco Provided	Default logical profile for medical devices.
Mobile Devices	Cisco Provided	Default logical profile for mobile devices.
Printers	Cisco Provided	Default logical profile for printers.

Creating Authorization Policy Based on Asset's Logical Profile

We will create an Authorization policy that determines the asset's network access. A Security Group Tag (SGT) will also be added to the Authorization Policy provided label to classify network traffic if Cisco's TrustSec Solution is used.

Step 1 Create IOT device SGT which will be used in the Authorization Policy
 Select WorkCenters->Trustsec->Components->Add->IOT Devices

Security Groups List > IOT_Devices

Security Groups

- * Name: IOT_Devices
- * Icon: A grid of icons representing various network and device types.
- Description: (Empty text area)

Step 2 Select Save

Step 3 Create ISE Authorization Profile Policy

Step 4 Select Policy->Policy Sets->View ">">Authorization Policy

Step 5 You should see the authorization policy:

Status	Rule Name	Conditions	Results	Hits	Actions
Search	MDM	MDM-MDMServerName EQUALS Germantown03	PermitAccess, BYOD	0	
AND	Wireless Black List Default	IdentityGroup-Name EQUALS Endpoint Identity Groups:Blacklist	Blackhole_Wireless_Access, Select from list	0	
	Profiled Cisco IP Phones	IdentityGroup-Name EQUALS Endpoint Identity Groups:Profiled:Cisco-IP-Phone	Cisco_IP_Phones, Select from list	0	

Step 6 Under Actions, Click on “gear” and “Insert new rule above

Step 7 You should see the following:

Screenshot of the Cisco Identity Services Engine (ISE) Policy Elements interface under Authorization Policy - Local Exceptions.

The interface shows a table with columns: Status, Rule Name, Conditions, Results, Profiles, and Security Groups. A search bar and two dropdown menus for selecting profiles and security groups are also present.

Status	Rule Name	Conditions	Results	Profiles	Security Groups
	Authorization Rule 1				

- Step 8** Name Authorization Rule 1 to **IOT_Example_Rule**, Under Condition, select “+”
Step 9 Click on **Attribute**, you should see the following Dictionary Attributes

Conditions Studio

Library

Search by Name

- BYOD_is_Registered
- Catalyst_Switch_Local_Web_Authentication
- Compliance_Unknown_Devices
- Compliant_Devices
- EAP-MSCHAPv2

Editor

Click to add an attribute

Select attribute for condition

Dictionary	Attribute	ID	Info
All Dictionaries	Attribute	ID	
Airespace	Aire-Datas-Bandwidth-Average...	7	
Airespace	Aire-Datas-Bandwidth-Average...	13	
Airespace	Aire-Datas-Bandwidth-Burst-Do...	9	

- Step 10** Select Endpoints->Logical Profile->Contains->IOT1Devices

Editor

EndPoints-LogicalProfile

Equals IOT1Devices

Set to 'is not'

Duplicate Save

- Step 11** Select Use
You should see:

Screenshot of the Cisco Identity Services Engine (ISE) Policy Elements interface under Authorization Policy - Local Exceptions.

The interface shows a table with columns: Status, Rule Name, Conditions, Results, Profiles, Security Groups, Hits, and Actions. A search bar and two dropdown menus for selecting profiles and security groups are also present.

Status	Rule Name	Conditions	Results	Profiles	Security Groups	Hits	Actions
	ACME_IOT_Example_Rule	EndPoints-LogicalProfile CONTAINS ACME_IOT Device					

- Step 12** Under **Profiles**, select **Permit Access**
Step 13 Under **Security Groups**, select **IOT Devices**
 You should see:

Status	Rule Name	Conditions	Results	Profiles	Security Groups
<input checked="" type="checkbox"/>	ACME_IOT_Example_Rule	EndPoints:LogicalProfile CONTAINS ACME_IOT Device	<input checked="" type="checkbox"/> PermitAccess	<input checked="" type="checkbox"/> IOT_Devices	

- Step 14** Select Save
Step 15 You should see:

Status	Rule Name	Conditions	Results	Profiles	Security Groups	Hits	Actions
<input checked="" type="checkbox"/>	ACME_IOT_Example_Rule	EndPoints:LogicalProfile CONTAINS ACME_IOT Device	<input checked="" type="checkbox"/> PermitAccess	<input checked="" type="checkbox"/> IOT_Devices		0	

Verifying Asset as Defined by the Logical Profile

The Asset policy is now assigned to the logical profile and verified in the Context Visibility Endpoint Classification screen.

Step 1 Run script again, type: `./run_publisher38.sh`

```

```

Step 2 Select->Context Visibility->Endpoint->Endpoint Classification

Note that both the original asset endpoint and the updated one are now assigned to the IOT_Example1 profile.

The screenshot shows the Cisco Identity Services Engine (ISE) interface. At the top, there are tabs for Home, Context Visibility, Operations, Policy, Administration, and Work Centers. Below the tabs, there are sub-tabs for Endpoints, Users, Network Devices, and Application. The main content area has three main sections: ENDPOINTS, ENDPOINT CATEGORIES, and NETWORK DEVICES. Each section contains a donut chart and a table of data. The ENDPOINTS section shows mobile devices (33.33%) and misc (66.67%). The ENDPOINT CATEGORIES section shows apple, inc. (33.33%) and unknown (66.67%). The NETWORK DEVICES section shows locations (100%). Below these sections is a table with columns for MAC Address, Anomalous Br., IPv4 Address, Username, Hostname, Location, Endpoint Profile, Description, OUI, and OS Types. The table contains three rows of data.

MAC Address	Anomalous Br.	IPv4 Address	Username	Hostname	Location	Endpoint Profile	Description	OUI	OS Types
10:DD:B1:C9:3C:39		192.168.1.136	jeppich	johns-macbo...	Location → Ai...	Apple-Device		Apple, Inc.	Apple Mac OS X 10.
7A:F9:AE:9A:18:00		123.157.179.78				IOT_Example1		UNKNOWN	Apple Mac OS X 10.
B0:2C:27:93:FE:94		125.84.172.120				IOT_Example1		UNKNOWN	Apple Mac OS X 10.

Step 3 If you click on either of the MAC addresses, you will see the logical profile

The screenshot shows the Cisco Identity Services Engine (ISE) interface, specifically the endpoint details for a selected MAC address. The top navigation bar includes Home, Context Visibility, Operations, Policy, Administration, and Work Centers. Below the navigation bar, there are tabs for Endpoints, Users, Network Devices, and Application. The main content area shows the selected endpoint details: MAC Address: 7A:F9:AE:9A:18:00, Username: (empty), Endpoint Profile: IOT_Example1, Current IP Address: 123.157.179.78, and Location: (empty). Below this, there are tabs for Applications, Attributes, Authentication, Threats, and Vulnerabilities. The Attributes tab is selected. Under the General Attributes section, there are several key-value pairs: Static Assignment: false, Endpoint Policy: IOT_Example1, Static Group Assignment: false, and Identity Group Assignment: IOT_Example1.

Creating Profiling Policy based on Asset Custom Attributes

A custom asset policy “CustomIOT” will be created. The custom attribute will be “assetgroup” and the value” will be “root”. The custom attribute endpoint setting must be enabled in ISE to use this feature.

Enabling Custom Attribute Value

Step 1 Select Administration->System->Settings->Profiling->enable->Enable

The screenshot shows the 'Profiler Configuration' page under 'Administration > System > Settings > Profiling'. On the left sidebar, 'Posture' is expanded. In the main area, the 'Enable Custom Attribute for Profiling Enforcement' checkbox is checked.

Step 2 Select Save

Select->Administration->Identity Management->Settings->Endpoint Custom Attributes

The screenshot shows the 'Endpoint Custom Attributes' page under 'Administration > Identity Management > Settings'. The 'Endpoint Custom Attributes' section lists several attributes like PostureApplicable, EndPointPolicy, etc. Below it, a form is used to add a new attribute: 'Attribute name' is set to 'assetGroup' and 'Type' is set to 'String'. The 'Save' button is highlighted.

Step 4 Select Save

Step 5 Select Policy-Profilin->Profiling Policies->Add
 You will see the following:

- Step 6** Enter: **CustomIOT** for Name
Step 7 Under Rules->If Condition->Create New Condition(Advanced Option)
Step 8 Under Expression->Select Attribute->**CUSTOMATTRIBUTE**
Step 9 You should see:

Step 10 Select assetGroup:contains:Root, enter, increase certainty factor to 100

Profiler Policy List > New Profiler Policy

Profiler Policy

* Name	CustomIOT	Description	
Policy Enabled	<input checked="" type="checkbox"/>		
* Minimum Certainty Factor	10	(Valid Range 1 to 65535)	
* Exception Action	NONE		
* Network Scan (NMAP) Action	NONE		
Create an Identity Group for the policy	<input checked="" type="radio"/> Yes, create matching Identity Group		
	<input type="radio"/> No, use existing Identity Group		
* Parent Policy	NONE		
* Associated CoA Type	Global Settings		
System Type			
Rules			
If Condition	CUSTOMATTRIBUTE_assetGroup_CONT...	Then	10
Condition Name	CUSTOMATTRIB...	Expression	CONTAINS Root
<input type="button" value="Submit"/> <input type="button" value="Cancel"/>			

CUSTOMATTRIBUTE

Step 11 Select Submit

You should see the policy:

Identity Services Engine Home > Context Visibility > Operations > Policy > Administration > Work Centers

Click here to do wireless setup and visibility setup Do not show this again.

Profiling Policies	Policy Enabled	System Type	Description
custom	Enabled	Administrator Created	

Step 12 Add CustomIOTDevices to Logical Profile

Select Profiling->Logical Profiles->Add->Name: CustomIOTDevices->Policy Assignment->Available Policies->CustomIOT and move to Assigned Polices

Logical Profiles List > CustomIOTDevices

Logical Profile

* Name	CustomIOTDevices	Description	
* Policy Assignment			
Available Policies:	Assigned Policies:		
2Wire-Device 3Com-Device Aastra-Device Aastra-IP-Phone Aerohive-Access-Point Aerohive-Device American-Power-Conversion-Device Android	<input type="button" value=">"/> <input type="button" value="<"/> <input type="button" value=">>"/> <input type="button" value="<<"/>	CustomIOT	

Step 13 Select Submit

Step 14 You should see the logical profile **CustomIOTDevices**

Logical Profiles	System Type	Description
Cameras	Cisco Provided	Default logical profile for cameras.
CustomIOTDevices	Administrator Created	
Gaming Devices	Cisco Provided	Default logical profile for gaming devices.
Home Network Devices	Cisco Provided	Default logical profile for home network devices.
IOT1Devices	Administrator Created	
IP-Phones	Cisco Provided	Default logical profile for IP Phones.
Infrastructure Network Devices	Cisco Provided	Default logical profile for infrastructure network devices.
Medical Devices	Cisco Provided	Default logical profile for medical devices.
Mobile Devices	Cisco Provided	Default logical profile for mobile devices.
Printers	Cisco Provided	Default logical profile for printers.

Step 15 Run script `./run_publisher38.sh`

```
Johns-MacBook-Pro-2:api_simulator jeppich$ ./run_publisher38.sh

.\\ /_` .

```

Step 16 Press Enter

```
ClientEndpoint      : STOMP SEND topic=/topic/com.cisco.endpoint.asset
```

```
command=SEND, headers={'content-length':'591','destination':'/topic/com.cisco.endpoint.asset'},  
content_length=591  
15-Apr-18 00:19:00.175 [main-1]:  
{ "assetHwRevision": "5.6", "assetProtocol": "CIP", "assetConnectedLinks": [{"value": "3", "key": "indattr2"}, {"value": "Root", "key": "assetGroup"}], {"value": "1", "key": "indattr3"}], "assetVendor": "Cisco Systems", "assetSwRevision": "4.6", "assetCustomAttributes": [{"value": "3", "key": "indattr2"}, {"value": "Root", "key": "assetGroup"}, {"value": "1", "key": "indattr3"}], "assetProductId": "IE2000", "assetSerialNumber": "1212121213243", "assetMacAddress": "48:b2:d0:63:d1:32", "assetId": "260", "assetIpAddress": "56.56.217.16", "assetName": "Abjergary n - 47", "assetDeviceType": "EtherNet/\IP Node"}
```

Step 17 Select Context Visibility->Endpoints-Authentication or Endpoint Classification

You will see the asset device

MAC Address	Status	IPv4 Address	Username	Hostname	Location	Endpoint Profile	Authentication Failure Reason	Authentication Policy	Authorization
48:B2:D0:63:D1:32	Status	56.56.217.16				IOT_Example1	Authentication Failure Reason	Authentication Policy	Authorization

Step 18 Select MAC address of the endpoint devices, then Attributes

You will see “AssetGroup” under “Attribute Name” and “Root” under “Attribute Value”. Note the Logical Profile still shows IOT_Example1.

Screenshot of the Cisco Identity Services Engine (ISE) interface showing device assignment details and custom attributes.

Device Assignment:

Static Assignment	false
Endpoint Policy	IOT_Example1
Static Group Assignment	false
Identity Group Assignment	IOT_Example1

Custom Attributes:

Attribute Name	Attribute Value
assetGroup	Root
LogicalProfile	

Other Attributes:

BYODRegistration	Unknown
DeviceRegistrationStatus	NotRegistered
ElapsedDays	0
EndPointPolicy	IOT_Example1
EndPointProfilerServer	ise24fc3.lab10.com
EndPointSource	PXGRIDPROBE
IdentityGroup	IOT_Example1
InactiveDays	0
LogicalProfile	IOT1Devices

Step 19 Select Policy->Profiling->Profiling Policies->Quick filter->"iot"

You will see both profiling policies

Screenshot of the Cisco Identity Services Engine (ISE) interface showing the Profiling Policies list.

Profiling Policies:

Profiling Policy Name	Policy Enabled	System Type	Description
iot	Enabled	Administrator Created	
IOT_Example1	Disabled	Administrator Created	

Step 20 Select->IOT_Example1->unchecked policy enabled

Profiler Policy List > IOT_Example1

Profiler Policy

* Name	IOT_Example1	Description	
Policy Enabled	<input type="checkbox"/>		
* Minimum Certainty Factor	10	(Valid Range 1 to 65535)	
* Exception Action	NONE		
* Network Scan (NMAP) Action	NONE		
Create an Identity Group for the policy	<input checked="" type="radio"/> Yes, create matching Identity Group <input type="radio"/> No, use existing Identity Group hierarchy		
* Parent Policy	NONE		
* Associated CoA Type	Global Settings		
System Type	Administrator Created		

Step 21 Select Save

Step 22 Select-> Context Visibility->Endpoints or Endpoint Classification

You will now see the proper endpoint profile and logical profile.

The screenshot displays the Cisco Identity Services Engine (ISE) web interface. The top navigation bar includes links for Home, Context Visibility, Operations, Policy, Administration, and Work Centers. A license warning message is visible in the top right corner. The main content area is titled 'Context Visibility' and has tabs for Endpoints, Users, Network Devices, Application, Authentication, BYOD, Compliance, Compromised Endpoints, Endpoint Classification, Guest, Vulnerable Endpoints, and Hardware. The 'Endpoints' tab is currently selected. Below the tabs, there are three main sections: 'INACTIVE ENDPOINTS' (listing one endpoint), 'AUTHENTICATION STATUS' (showing 'No data available.'), and 'AUTENTICATIONS' (also showing 'No data available.'). At the bottom, there is a table with columns for MAC Address, Status, IPv4 Address, Username, Hostname, Location, Endpoint Profile, Authentication Failure Reason, Authentication Policy, and Authorization. One row is selected, showing '48:B2:D0:63:D1:32' as the MAC Address and '56.56.217.16' as the IP address.

Creating Authorization Policy Based on Asset's Logical Profile for Custom Attributes

An authorization policy will be created that determines the asset's network access. A Security Group Tag (SGT) will also be added to the Authorization Policy provided label to classify network traffic if Cisco's TrustSec Solution is used.

Step 1 Create IOT device SGT which will be used in the Authorization Policy

Select WorkCenters->Trustsec->Components->Add->CustomIOTDevices

Security Groups List > **CustomIOTDevices**

Security Groups

* Name
CustomIOTDevices

* Icon

Description

Propagate to ACI

Security Group Tag (Dec / Hex): 17/0011

Generation Id: 0

Step 2 Select Save

Step 3 Create ISE Authorization Profile Policy

Step 4 Select Policy->Policy Sets->View ">">Authorization Policy

Step 5 You should see:

Status	Rule Name	Conditions	Results	Hits	Actions
Green	MDM	MDM-MDMServerName EQUALS Germantown03	PermitAccess, BYOD	0	
Green	Wireless Black List Default	AND IdentityGroup-Name EQUALS Endpoint Identity Groups:Blacklist	Blackhole_Wireless_Access, Select from list	0	
Green	Profiled Cisco IP Phones	IdentityGroup-Name EQUALS Endpoint Identity Groups:Profiled:Cisco-IP-Phone	Cisco_IP_Phones, Select from list	0	

Step 6 Under Actions, Click on “gear” and “Insert new rule above

Step 7 You should see the following:

Status	Rule Name	Conditions	Results	Profiles	Security Groups
	Authorization Rule 1	+	Select from list	+	Select from list

Step 8 Name Authorization Rule 1 to **CustomIOTDevices**, Under Condition, select “+”

Step 9 Click on **Attribute** , you should see the following Dictionary Attributes

Conditions Studio

Dictionary	Attribute	ID	Info
All Dictionaries	Attribute	ID	
Airespace	Aire-Data-Bandwidth-Average...	7	
Airespace	Aire-Data-Bandwidth-Average...	13	
Airespace	Aire-Data-Bandwidth-Burst-Do...	9	

Step 10 Select **Endpoints->assetGroup->Contains->Root**

Conditions Studio

Step 11 Select Use

Under Profiles, select Permit Access

Under Security Groups, select CustomIOTDevices

You should see:

The screenshot shows the Cisco Identity Services Engine interface. In the top navigation bar, 'Policy Sets' is selected. Under 'Policy Elements', there is a list of authorization policies: 'Authorization Policy - Local Exceptions', 'Authorization Policy - Global Exceptions', and 'Authorization Policy (14)'. The 'Authorization Policy (14)' item is expanded, showing a table with columns: Status, Rule Name, Conditions, Results, Profiles, Security Groups, Hits, and Actions. A search bar at the bottom left is set to 'Search'. Below the table, a condition is defined: 'EndPoints:assetGroup CONTAINS Root'. To the right of the condition, there is a button labeled 'PermitAccess' and a dropdown menu showing 'CustomIOTDevices'.

Step 14 Select Save

Verifying Asset as Defined by the Logical Profile for Custom Attributes

The custom asset policy is now assigned to the logical profile. This is verified in the Context Visibility Endpoint Classification screen.

Step 1 Run script again, type: `./run_publisher38.sh`

```

. /etc/cisco/ise/ise.sh

Step 2 Select->Context Visibility->Endpoint->Endpoint Classification

Note that the client endpoint is now assigned to the CustomIOT profile.

MAC Address	Anomalous...	IPv4 Address	Username	Hostname	Location	Endpoint Profile	Description	OUI	OS Types
94:D4:CB:57:CA:7C	Anomalous Br	0.163.69.187				CustomIOT		UNKNOWN	

Step 3 If you click on the MAC address, you will see the logical profile of CustomIOT devices. You may also see IOTDevices if you did not remove the CutomIOT device policy from IOT devices logical profile.

Attribute Name	Attribute Value
assetGroup	Root

Attribute Name	Attribute Value
BYODRegistration	Unknown
DeviceRegistrationStatus	NotRegistered
ElapsedDays	1
EndPointPolicy	CustomIOT
EndPointProfilerServer	ise24fc3.lab10.com
EndPointSource	PXGRITDPROBE
IdentityGroup	CustomIOT
InactiveDays	1
LogicalProfile	IOT1Devices,CustomIOTDevices

Editing Script Values

The API_Simulator CustomPublisher.java code needs to be modified to modify the asset values in the script. In this example, Maven is used.

Step 1 Copy the api_simulator/pxgrid-rest-ws folder over to your maven repository.

```
/Users/jeppich/maven/repo/pxgrid-rest-ws
```

Step 2 Go to the java folder, and see the pom.xml file and the src folder

```
johns-macbook-pro:pxgrid-rest-ws jeppich$ cd java
johns-macbook-pro:java jeppich$ ls
pom.xml           src
run_publisher.sh   target
```

Step 3 Go to the http folder

```
/Users/jeppich/maven/repo/pxgrid-rest-ws/java/src/main/java/com/cisco/pxgrid/samples/ise/http
```

Step 4 You will see the sample code

Console.java	SampleHelper.java
CustomPublisher.java	SessionQueryAll.java
CustomSubscriber.java	SessionQueryByIP.java
DeviceList.java	SessionSubscribe.java
Devices.java	StompFrame.java
PublisherController.java	StompPubsubClientEndpoint.java
PxgridControl.java	StompSubscription.java
SampleConfiguration.java	

Step 5 Edit the CustomPublisher.java file, to change any of the values, keep the prefix name (i.e.) **object.put(prefix+"Vendor",**, and change the value name (i.e. "Cisco Systems"); in the section of the code below. The (prefix + ".") values cannot be changed as they represent the values in the IOTASSETS dictionary.

```
package com.cisco.pxgrid.samples.ise.http;

import java.net.URI;
import java.nio.charset.StandardCharsets;
import java.util.HashMap;
import java.util.Map;
import javax.net.ssl.HostnameVerifier;
import javax.net.ssl.SSLSession;
import java.util.Random;
import org.glassfish.tyrus.client.ClientManager;
import org.glassfish.tyrus.client.ClientProperties;
import org.glassfish.tyrus.client.SslEngineConfigurator;
import org.glassfish.tyrus.client.auth.Credentials;
import org.json.simple.JSONArray;
import org.json.simple.JSONObject;
import java.util.concurrent.ThreadLocalRandom;
```

```

import com.cisco.pxgrid.model.AccountState;
import com.cisco.pxgrid.model.Service;
import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;

/**

    //endpoint.disconnect("ID-123");
    // Wait for disconnect receipt
    //Thread.sleep(3000);

    //session.close();
}

}

```

Step 6 Change the Vendor Name to “ACME” and Save the file

```

83         object.put(prefix+"Id",
84             Integer.toString(1+counterIncrement)+Integer.toString(15*ThreadLocalRandom.current().nextInt(1, 6 + 1)));
85         object.put(prefix+"Name", "Abjergaryn - "
86             +Integer.toString(ThreadLocalRandom.current().nextInt(1, 9 + 1)));
87         object.put(prefix+"IpAddress", getRandomIpAddress());
88         //+Integer.toString(ThreadLocalRandom.current().nextInt(45, 100 + 1)));
89         //object.put(prefix+"MacAddress",
90         //    "28:63:36:a2:94:"+Integer.toString(30+counterIncrement));
91         object.put(prefix+"MacAddress", getRandomMacAddress());
92         object.put(prefix+"Vendor", "ACME");
93         object.put(prefix+"ProductId", "IE2000");
94         object.put(prefix+"SerialNumber", "1212121213243");
95         object.put(prefix+"DeviceType", "EtherNet/IP Node");
96         object.put(prefix+"SwRevision", "4.6");
97         object.put(prefix+"HwRevision", "5.6");
98         object.put(prefix+"Protocol", "CIP");
99         JSONArray customAttr = new JSONArray();
100        JSONArray connectedLinks = new JSONArray();
101        JSONObject object1 = new JSONObject();
102        object1.put("key", "indattr2");
103        object1.put("value", "1234567890");

```

Line 89, Column 45 — 239 Lines INS UTF-8 ▾ Java ▾ Spaces: 4

Step 7 Go to folder

```

johns-macbook-pro:java jeppich$ ls
pom.xml           src
run_publisher.sh   target
johns-macbook-pro:java jeppich$ 

```

Step 8 Run mvn install to recompile

```

johns-macbook-pro:java jeppich$ mvn install

```

johns-macbook-pro:java jeppich\$

Step 9 Replace the `/Applications/api_partner_fc3/api_simulator/snapshot.jar` file with the one that was just created. (i.e. `/Users/jeppich/.m2/repository/com/cisco/pxgrid/pxgrid-rest-ws-samples/2.0.0-SNAPSHOT`)

```
cp pxgrid-rest-ws-samples-2.0.0-SNAPSHOT.jar /Applications/api_partner_fc3/api_simulator
```

Step 10 Run the script, you should see “ACME” in the Asset Vendor

```
ClientEndpoint : STOMP SEND topic=/topic/com.cisco.endpoint.asset
command=SEND, headers={'content-length':'581','destination':'/topic/com.cisco.endpoint.asset',},
content.length=581
```

```
21-Apr-18 16:35:37.330 [main-1]:
{"assetHwRevision":"5.6","assetProtocol":"CIP","assetConnectedLinks":[{"value":"3","key":"indattr2"}, {"value":"Root","key":"assetGroup"}, {"value":"1","key":"indattr3"}], "assetVendor": "ACME", "assetSwRevision": "4.6", "assetCustomAttributes": [{"value": "3", "key": "indattr2"}, {"value": "Root", "key": "assetGroup"}, {"value": "1", "key": "indattr3"}], "assetProductId": "IE2000", "assetSerialNumber": "1212121213243", "assetMacAddress": "00:66:cd:b6:17:d6", "assetId": "275", "assetIpAddress": "115.86.71.7", "assetName": "Abjergaryn - 41", "assetDeviceType": "EtherNet\IP Node"}
```

Step 11 You can now create a Profiling Policy based on IOTASSET assetvendor attribute using

[Profiler Policy List > VendorACME](#)

Profiler Policy

* Name	VendorACME	Description
Policy Enabled	<input checked="" type="checkbox"/>	
* Minimum Certainty Factor	10	(Valid Range 1 to 65535)
* Exception Action	NONE	
* Network Scan (NMAP) Action	NONE	
Create an Identity Group for the policy	<input checked="" type="radio"/> Yes, create matching Identity Group	
	<input type="radio"/> No, use existing Identity Group hierarchy	
* Parent Policy	NONE	
* Associated CoA Type	Global Settings	
System Type	Administrator Created	
Rules	If Condition: IOTASSET_assetVendor_CONTAINS_ACME Then: Certainty Factor Increases: 100	

Step 12 You can also create a logical profile VendorACME

[Logical Profiles List > VendorACME](#)

Logical Profile

* Name	VendorACME	Description
* Policy Assignment		
Available Policies:	Assigned Policies:	
2Wire-Device 3Com-Device Aastra-Device Aastra-IP-Phone Aerohive-Access-Point Aerohive-Device American-Power-Conversion-Device Android	> < >> <<	VendorACME

Step 13 Select Context Visibility->Endpoints->Authentications, you should see “VendorACME” for the EndpointProfile

Note: If you see, “CustomIOTDevices”, disable “CustomIOTDevices” profiling policy for this exercise.

MAC Address	Status	IPv4 Address	Username	Hostname	Location	Endpoint Profile	Authentication Failure Reason	Authentication Policy	Authorization
F2:EE:16:D8:49	201.154.160.46					VendorACME			

Editing/Adding Customer Values

Step 1 Copy the api_simulator/ pxgrid-rest-ws folder over to your maven repository

```
/Users/jeppich/maven/repo/pxgrid-rest-ws
```

Step 2 Go to the java folder, and see the pom.xml file and the src folder

```
johns-macbook-pro:pxgrid-rest-ws jeppich$ cd java
johns-macbook-pro:java jeppich$ ls
pom.xml           src
run_publisher.sh   target
```

Step 3 Go to the http folder

```
/Users/jeppich/maven/repo/pxgrid-rest-ws/java/src/main/java/com/cisco/pxgrid/samples/ise/http
```

Step 4 You will see the sample code

Console.java CustomPublisher.java CustomSubscriber.java	SampleHelper.java SessionQueryAll.java SessionQueryByIP.java
---	--

DeviceList.java	SessionSubscribe.java
Devices.java	StompFrame.java
PublisherController.java	StompPubsubClientEndpoint.java
PxgridControl.java	StompSubscription.java
SampleConfiguration.java	

Step 5 Edit the CustomPublisher.java file, replace **object1.put (“key”, “inadtr2”)** with **object1.put (“key”, “CVSS”)**

Step 6 Also replace **object1.put(“value”,”3”)** with **object1.put (“value”,”7”)** in the highlighted fields below.

These fields will represent the custom attribute values of “key” and “value” that will be added to the ISE identity custom attribute screen and also when creating the CUSTOMATTRIBUTE profiling policy.

```

```

Step 9 Replace the **/Applications/api_partner_fc3/api_simulator/snapshot.jar** file with the one that was just created. (i.e **/Users/jeppich/.m2/repository/com/cisco/pxgrid/pxgrid-rest-ws-samples/2.0.0-SNAPSHOT**)

```
cp pxgrid-rest-ws-samples-2.0.0-SNAPSHOT.jar /Applications/api_partner_fc3/api_simulator
```

Step 10 Run the script, you should see “**value”：“7”, “key”：“CVSS**” in the output

```
ClientEndpoint : STOMP SEND topic=/topic/com.cisco.endpoint.asset
command=SEND, headers={'content-length': '576', 'destination': '/topic/com.cisco.endpoint.asset'}, 
content.length=576
21-Apr-18 21:56:49.171 [main-1]:
{"assetHwRevision": "5.6", "assetProtocol": "CIP", "assetConnectedLinks": [{"value": "7", "key": "CVSS"}, {"value": "Ro
ot", "key": "assetGroup"}, {"value": "1", "key": "indattr3"}], "assetVendor": "ACME", "assetSwRevision": "4.6", "assetCu
stomAttributes": [{"value": "7", "key": "CVSS"}, {"value": "Root", "key": "assetGroup"}, {"value": "1", "key": "indattr3"
"}], "assetProductId": "IE2000", "assetSerialNumber": "1212121213243", "assetMacAddress": "b4:54:0a:e8:c1:fd", "asset
```

```
Id": "275", "assetIpAddress": "117.65.215.140", "assetName": "Abjergaryn - 43", "assetDeviceType": "EtherNet\IP Node"}
```

Step 11 Select Administration->System->Settings->Endpoint Custom Attributes, and add CVSS as the attribute name and int as the Type

Mandatory	Attribute Name	Data Type
	PostureApplicable	STRING
	EndPointPolicy	STRING
	AnomalousBehaviour	STRING
	OperatingSystem	STRING
	BYODRegistration	STRING
	PortalUser	STRING
	LastAUPAcceptanceHours	INT
	LogicalProfile	STRING

Endpoint Custom Attributes

Attribute name	Type
assetGroup	String
CVSS	Int

Step 12 Select Save

Step 13 Create CVSSAttribute Profiling Policy that will be used to define the CUSTOMATTRIBUTE

Step 14 Create CVSSAttribute Logical Profile is also created.

Note: Disable VendorACME policy if enabled

Logical Profiles List > CVSSAttributeProfile

Logical Profile

* Name Description

* Policy Assignment

Available Policies:

2Wire-Device
3Com-Device
Astra-Device
Astra-IP-Phone
Aerohive-Access-Point
Aerohive-Device
American-Power-Conversion-Device
Android

Assigned Policies:

CVSSAttribute

Step 15 Run the script, you should see “**value**”:”7”, “**key**”：“CVSS” in the output

```
ClientEndpoint : STOMP SEND topic=/topic/com.cisco.endpoint.asset
command=SEND, headers={'content-length': '575', 'destination': '/topic/com.cisco.endpoint.asset'}, content.length=575
21-Apr-18 22:25:59.684 [main-1]:
{"assetHwRevision": "5.6", "assetProtocol": "CIP", "assetConnectedLinks": [{"value": "7", "key": "CVSS"}, {"value": "Root", "key": "assetGroup"}], "assetVendor": "ACME", "assetSwRevision": "4.6", "assetCustome
stomAttributes": [{"value": "7", "key": "CVSS"}, {"value": "Root", "key": "assetGroup"}, {"value": "1", "key": "indattr3"}], "assetProductId": "IE2000", "assetSerialNumber": "1212121213243", "assetMacAddress": "66:fe:67:4f:2c:4b", "asset
Id": "230", "assetIpAddress": "92.56.144.244", "assetName": "Abjergaryn - 44", "assetDeviceType": "EtherNet/IP
Node"}
```

Step 16 Select Context Visibility->Endpoints->Authentication, you will see CVSSAttribute Endpoint Profile

MAC Address	Status	IPv4 Address	Username	Hostname	Location	Endpoint Profile	Authentication Failure Reason	Authentication Policy	Authorization
66:FE:67:4F:2C:4B	92.56.144.244					CVSSAttribute			

API_Simulator Context-In Code

        return new DeviceList(device_list);
    }
}

```

Custom Publisher

The CustomPublisher Java code publishes the asset device attributes by calling the service name “com.cisco.endpoint.asset”, topic path “/topic/com.cisco.endpoint.asset”, PUBSERVCE “com.cisco.ise.pubsub”.

This will return the wsPubsubService: “com.cisco.ise.pubsub”, restbaseUrl <http://raghdasa-lnv1:8080>, and assetTopic, “/topic/com.cisco.endpoint.asset”.

```

Stompframe.java

This code handles the STOMP message frame

```

package com.cisco.pxgrid.samples.ise.http;

import java.io.IOException;
import java.io.InputStream;
import java.io.OutputStream;
import java.text.ParseException;
import java.util.HashMap;
import java.util.Map;

/**
 * This follows STOMP 1.2 specification to parse and generate STOMP frames:
 * https://stomp.github.io/stomp-specification-1.2.html
 *
 * This single class is self-sufficient handle all STOMP frames.
 *
 * Note for WebSocket:
 * If input comes as WebSocket text type, (WS RFC says Text is UTF-8)
 * server side handling code like Spring TextMessage may convert the bytes to String as UTF-8
 * which maybe the wrong encoding as STOMP frame itself can use other encoding.
 * e.g. A particular encoding may have bytes: FF FF FF FF FF FF FF FF FF... 10, that is completely out
 * of range for Unicode.
 * Unless STOMP body is also UTF-8, STOMP frame must be sent as binary
 *
 * @author Alan Lei

Endpoint Asset Configuration

Service: com.cisco.endpoint.asset

This is endpoint asset service topic

Service properties

Name	Description	Example
restBaseUrl	The base URL for REST APIs	https://[ind-host1]:8910/pxgrid/ind/asset
wsPubsubService	The WebSocket Pubsub service name	com.cisco.ise.pubsub
assetTopic	Topic for asset events	/topic/com.cisco.endpoint.asset

assetTopic WS Stomp message:

```
{
  "asset": Asset object,
  "opType": operation type
}
```

"opType" will be one of the following strings: CREATE/UPDATE/DELETE

Sample Response:

```
{
  "asset": {
    "assetId": 20101,
    "assetName": "switchxbx208",
    "assetIpAddress": "172.27.162.172",
    "assetMacAddress": "00:1b:1b:0f:19:23",
    "assetVendor": "Siemens",
    "assetProductId": "6GX5 208-0BA10-2AA3",
    "assetSerialNumber": "VPB9559430",
    "assetDeviceType": "Switch",
    "assetSwRevision": "",
    "assetHwRevision": "",
    "assetProtocol": "PROFINET",
    "assetConnectedLinks": [
      {
        "assetId": "105",
        "assetName": "IE5k-162-162.cisco.com",
        "assetIpAddress": "172.27.162.162",
        "assetPortName": "GigabitEthernet1/4",
        "assetDeviceType": "Switch"
      }
    ],
    "assetCustomAttributes": []
  },
  "opType": "CREATE"
}
```

POST [restBaseUrl]/getAssets

This is used to get all Endpoint devices.

Request URL: [restBaseUrl]/getAssets

Request Method: POST

Content-Type: application/json

Accept: application/json

Authorization: Basic [nodeName]:[secret]

Label	Description
[restBaseUrl]	Obtain by ServiceLookup of com.cisco.endpoint.asset
[nodeName]	pxGrid node name
[secret]	Obtain via AccessSecret

Request:

```
{
  "limit": integer (optional),
  "offset": integer (optional)
}
```

Parameter	Description	Default Value
limit	Number of records per page	500
offset	Zero based page index	0

Response:

```
{
  "assets": [
```

```
array of Asset objects  
]  
}
```

"Asset" Object

Name	Type	Description
assetId	Long	IND DB id for the asset
assetName	String	Asset name
assetIpAddress	String	IP address
assetMacAddress	String	MAC address
assetVendor	String	Manufacturer
assetProductId	String	Product Code
assetSerialNumber	String	Serial Number
assetDeviceType	String	Device Type
assetSwRevision	String	S/W Revision number
assetHwRevision	String	H/W Revision number
assetProtocol	String	
assetConnectedLinks		Array of Link object
assetCustomAttributes		Array of name-value pair in the form of Pair object

Asset Custom Attributes

Key Name	Value Type	Description	Supported IND Version
assetGroup	String	Fully qualified group name assigned to the Asset	1.3, 1.4
assetTag	String	Security Tag assigned to the Asset	1.4

"Link" Object

Name	Type	Description
assetId	Long	IND DB id for the connected asset
assetName	String	Connected Asset name
assetIpAddress	String	Connected Asset IP address
assetPortName	String	Name of the interface that the asset is connected to
assetDeviceType	String	Device Type

"Pair" Object

Name	Type	Description
key	String	Custom attribute name
value	String	Custom attribute value

Sample Response:

```

POST [restBaseUrl]/getSyncStatus

This is used to get the sync status of the IND Pxgrid Service.

Request URL: [restBaseUrl]/getSyncStatus

Request Method: POST

Content-Type: application/json

Accept: application/json

Authorization: Basic [nodeName]:[secret]

Label	Description
[restBaseUrl]	Obtain by ServiceLookup of com.cisco.endpoint.asset
[nodeName]	pxGrid node name
[secret]	Obtain via AccessSecret

Request:

```
{
```

```
}
```

Response:

```
{
IN_SYNC
}
```

Response will be one of the following strings: DISABLED/IN_SYNC/OUT_OF_SYNC
